## Introduction

. Laravel هو إطار عمل MVC مع الحزم والترحيلات و Artisan CLI. يقدم ملف Laravel مجموعة قوية من الأدوات وبنية تطبيق تضم العديد من أفضلها . . . . .  
Ruby on Rails و ASP.NET MVC و Yii و Codelgniter و Sinatra هو إطار عمل مفتوح المصدر .  
يحتوي على مجموعة غنية جدًا من الميزات التي ستعزز . . . . .  
1- سرعة تطوير الويب. إذا كنت معتادًا على Advanced PHP و Core PHP ، فإن Laravel سيجعل مهمتك أسهل.  
2- سيعمل الكثير من الوقت إذا كنت تخاطط لتطوير موقع ويب من الصفر . . . . .  
3- ليس ذلك فحسب ، فالموقع المبني في Laravel آمن أيضًا. يمنع مختلف الهجمات التي يمكن أن تحدث على موقع الويب.

## Laravel – Features

Laravel offers the following key features:

( يقدم laravel الميزات الرئيسية التالية )

- Modularity
- Testability
- Routing
- Configuration management
- Query builder and ORM (Object Relational Mapper)
- Schema builder, migrations, and seeding
- Template engine
- E-mailing

- Authentication
- Redis
- Queues
- Event and command bus

### ما هو الشئ الذي تحتاجه قبل البدء بالlaravel

1- يجب ان يكون لديك معرفة في اساسيات HTML+CSS+Bootstrap+PHP

2- يجب ان يكون لديك سيرفر وفيه Apache,Mysql,php

3- يجب ان يكون لديك معرفة بال OOP

### Server requirements

\* لكي يقوم بتشغيل laravel يجب ان تتوفر فيه المواصفات التالية:

#### ○ PHP >= 7.2.5

1- يجب ان يكون php إصداره 7.2 او اكثر .

تقوم بالدخول الى موجه الاوامر cmd اختصار ل(command prompt) الموجود في الحاسبة وتقوم بكتابة الامر **php --version** سوف يظهر لك اصدار

```
C:\Users\user>php --version
PHP 7.1.11 (cli) (built: Oct 25 2017 21:07:06) ( ZTS MSVC14 (Visual C++ 2015) x86 )
Copyright (c) 1997-2017 The PHP Group
Zend Engine v3.1.0, Copyright (c) 1998-2017 Zend Technologies
```

#### 2- يجب ان يكون مفعل فيه extensions التالية:

لكي تتأكد من ان جميع الملحقات موجودة لديك داخل السيرفر تقوم بالدخول أيضا الى cmd وتنكتب الامر **php -m**

- BCMath PHP Extension
- Ctype PHP Extension
- Fileinfo PHP extension

- JSON PHP Extension
- Mbstring PHP Extension
- OpenSSL PHP Extension
- PDO PHP Extension
- Tokenizer PHP Extension
- Ctype PHP Extension

```
C:\Users\user>php -m
[PHP Modules]
bcmath
bz2
calendar
Core
ctype
curl
date
dom
exif
fileinfo
filter
ftp
gd
gettext
hash
iconv
json
libxml
mbstring
mcrypt
mysqli
```

### **What are the uses of Laravel:**

**PHP FRAMEWORK -1**  
هو مجموعة من الصفحات تستخدم الـ php الأصلي و تسهل  
وتسرع العمل على laravel لأنها تقوم بتجهيز الدالة مع خصائصها أي اننا لا نقوم ببناء الدالة  
من الصفر.

**: MVC -2**

**COMPOSER -3** : هو واجهة CLI وهي التي سوف تنفذ فيها جميع الابعادات الخاصة  
بالتطبيق.

## Laravel-Installation

والآن قبل البدء بمشروعك تأكد من تثبيت Composer على نظامك قبل تثبيت Laravel لديك.

**الخطوة الأولى:** قم بزيارة عنوان URL التالي وقم بتنزيل composer لتنسيقه على نظامك

<https://getcomposer.org/download/>

**الخطوة الثانية:** بعد تثبيت Composer ، تحقق من التثبيت عن طريق كتابة أمر **Composer** في موجه الأوامر cmd كما هو موضح في لقطة الشاشة التالية.

**الخطوة الثالثة:** أنشئ دليلاً جديداً في أي مكان في نظامك لمشروع Laravel الجديد. بعد ذلك انتقل إلى المسار حيث أنشأت الدليل الجديد واتكتب الأمر التالي هناك لتنصيب Laravel. وانشاء ملف باسم Platformiq

```
composer create-project laravel/laravel --prefer-dist laravel/laravel Platformiq
```

**الخطوة الرابعة:** سيقوم الأمر أعلاه بتنصيب Laravel في الدليل الحالي. ابدأ خدمة بتنفيذ الأمر التالي.

php artisan serve

**الخطوة الخامسة:** بعد تنفيذ الأمر أعلاه ، ادخل الى ملف `htdocs` ثم `xampp` و تقوم بتشغيل السيرفر و سترى شاشة كما هو موضح أدناه:

```
Microsoft Windows [Version 10.0.17763.1217]
(c) 2018 Microsoft Corporation. All rights reserved.

C:\Users\user>cd\

C:\>cd xampp

C:\xampp>cd htdocs

C:\xampp\htdocs>cd platformiq

C:\xampp\htdocs\platformiq>php artisan serve
Laravel development server started: <http://127.0.0.1:8000>
```

**الخطوة السادسة:** انسخ عنوان URL <http://127.0.0.1:8000> في لقطة الشاشة أعلاه وافتح عنوان URL هذا في المتصفح. إذا رأيت الشاشة التالية ، فهذا يعني أنه تم تثبيت Laravel بنجاح 😊

## Laravel-Application Structure

### Root Directory

يحتوي الدليل الجذر في **Laravel** على مجلدات وملفات مختلفة كما هو موضح في الشكل التالي:

**app:** This directory contains the core code of the application.

التطبيق: يحتوي هذا الدليل على الكود الأساسي للتطبيق.

**bootstrap:** This directory contains the application bootstrapping script.

bootstrap: يحتوي هذا الدليل على البرنامج النصي bootstrapping للتطبيق.

**config:** This directory contains configuration files of application.

التكوين: يحتوي هذا الدليل على ملفات التكوين للتطبيق.

**database:** This folder contains your database migration and seeds.

قاعدة البيانات: يحتوي هذا المجلد على ترحيل قاعدة البيانات والبذور.

**public:** This is the application's document root. It starts the Laravel application. It also contains the assets of the application like JavaScript, CSS, Images, etc.

عام: هذا هو جذر مستند التطبيق. يبدأ تطبيق Laravel. يحتوي أيضًا على أصول التطبيق مثل CSS و JavaScript والصور وما إلى ذلك.

**resources:** This directory contains raw assets such as the LESS & Sass files, localization and language files, and Templates that are rendered as HTML.

الموارد: يحتوي هذا الدليل على أصول أولية مثل ملفات LESS & Sass والترجمة واللغة والقوالب التي يتم عرضها بتنسيق HTML.

**storage:** This directory contains App storage, like file uploads etc. Framework storage (cache), and application-generated logs.

التخزين: يحتوي هذا الدليل على تخزين التطبيقات ، مثل تحميلات الملفات وما إلى ذلك. تخزين الإطار (ذاكرة التخزين المؤقت) ، والسجلات التي ينشئها التطبيق.

**test:** This directory contains various test cases.

اختبار: يحتوي هذا الدليل على حالات اختبار مختلفة.

**vendor:** This directory contains composer dependencies.

البائع: يحتوي هذا الدليل على تبعيات المؤلف .

## App Directory :

هذا هو دليل التطبيق. يحتوي على مجموعة متنوعة من الأدلة الإضافية الموضحة أدناه

- Console: All the artisan commands are stored in this directory.
  - وحدة التحكم: يتم تخزين جميع أوامر الحرفيين في هذا الدليل.
- Events: This directory stores events that your application can raise. Events may be used to alert other parts of your application that a given action has occurred, providing a great deal of flexibility and decoupling.

- الأحداث: يخزن هذا الدليل الأحداث التي يمكن لتطبيقك رفعها. يمكن استخدام الأحداث لتنبيه أجزاء أخرى من التطبيق الخاص بك إلى حدوث إجراء معين ، مما يوفر قدرًا كبيرًا من المرونة والفصل

- **Exceptions:** This directory contains your application's exception handler and is also a good place to stick any exceptions thrown by your application.

- الاستثناءات: يحتوي هذا الدليل على معالج استثناءات التطبيق الخاص بك وهو أيضًا مكان جيد للالتزام بأي استثناءات يطرحها تطبيقك

- **Http:** This directory contains your controllers, filters, and requests.

- يحتوي هذا الدليل على وحدات التحكم والفلاتر والطلبات.

- **Jobs:** This directory contains the queueable jobs for your application.

- الوظائف: يحتوي هذا الدليل على الوظائف القابلة للاختيار للتطبيق الخاص بك.

- **Listeners:** This directory contains the handler classes for your events. Handlers receive an event and perform logic in response to the event being **fired**. For example, a UserRegistered event might be handled by a SendWelcomeEmail listener.

- المستمعون: يحتوي هذا الدليل على فئات المعالج لأحداثك. تتلقى المعالجات حدثًا وتتفذ منطقاً ردًا على الحدث الذي يتم إطلاقه. على سبيل المثال ، قد تتم معالجة حدث UserRegistered بواسطة مستمع SendWelcome Email

- **Policies:** This directory contains various policies of the application.

- السياسات: يحتوي هذا الدليل على سياسات متنوعة للتطبيق.

- **Providers:** This directory contains various service providers.

- الموفرون: يحتوي هذا الدليل على العديد من مقدمي الخدمات.

## Basic Configuration (التكوين الأساسي)

- After installing Laravel, the first thing we need to do is to set the write permission for the directory **storage** and **bootstrap/cache**.

بعد تثبيت Laravel ، فإن أول شيء علينا القيام به هو تعين إذن الكتابة لتخزين الدليل و bootstrap / cache.

- Generate Application key to secure session and other encrypted data. If the root directory doesn't contain the **.env** file then rename the **.env.example** to **.env** file and execute the following command where you have installed Laravel. The newly generated key can be seen in the **.env** file.

إنشاء مفتاح التطبيق لتأمين الجلسة والبيانات المشفرة الأخرى. إذا كان الدليل الجذر لا يحتوي على ملف **.env** ، فقم بإعادة تسمية الملف **.env.example** إلى ملف **.env**. وتنفيذ الأمر **env**. التالي حيث قمت بتنصيب Laravel. يمكن رؤية المفتاح الذي تم إنشاؤه حديثاً في ملف **.env**.

من خلال تنفيذ الامر `php artisan key:generate`

```
C:\xampp\htdocs\platformiq>php artisan key:generate
Application key set successfully.

C:\xampp\htdocs\platformiq>
```

يمكنك أيضًا تكوين الإعدادات المحلية والمنطقة الزمنية وما إلى ذلك للتطبيق في ملف **config / app.php**.

## Environmental Configuration (التكوين البيئي)

يوفر **Laravel** تسهيلات لتشغيل تطبيقك في بيئات مختلفة مثل الاختبار والإنتاج وما إلى ذلك. يمكنك تكوين بيئتك تطبيقك في ملف **.env** الخاص بالدليل الجذر لتطبيقك. إذا قمت بتنصيب **composer** باستخدام **Laravel** ، فسيتم إنشاء هذا الملف تلقائياً.

```
APP_NAME=Laravel
APP_ENV=local
APP_KEY=base64:4q2PGnnz0qiTcsI9OTlseGxjhcb4ynIeTgNq91DB70=
APP_DEBUG=true
APP_URL=http://localhost

LOG_CHANNEL=stack

DB_CONNECTION=mysql
DB_HOST=127.0.0.1
DB_PORT=3306
DB_DATABASE=platformiq
DB_USERNAME=rahmaaltaee
DB_PASSWORD=12345

BROADCAST_DRIVER=log
CACHE_DRIVER=file
```

Activate Window

لاحظ النص الذي تحته خط باللون الأزرق في الصورة أعلاه. تم تعين متغير البيئة المحلية. يمكن أيضاً تغييرها إلى الإنتاج أو الاختبار حسب متطلباتك.

## Database Configuration

يمكن تكوين قاعدة بيانات التطبيق الخاص بك من ملف **config / database.php**. يمكنك تعين معلمات التكوين التي يمكن استخدامها بواسطة قواعد بيانات مختلفة ويمكنك أيضاً تعين المعلمة الافتراضية لاستخدامها.

```
'mysql' => [
    'driver' => 'mysql',
    'url' => env('DATABASE_URL'),
    'host' => env('DB_HOST', '127.0.0.1'),
    'port' => env('DB_PORT', '3306'),
    'database' => env('DB_DATABASE', 'forge'),
    'username' => env('DB_USERNAME', 'forge'),
    'password' => env('DB_PASSWORD', ''),
    'unix_socket' => env('DB_SOCKET', ''),
    'charset' => 'utf8mb4',
    'collation' => 'utf8mb4_unicode_ci',
    'prefix' => '',
    'prefix_indexes' => true,
```

# Laravel-PHPMysqladmin

## Laravel-Database

والآن بعد التعرف على **laravel** نبدأ بربط **phpmyadmin** مع **laravel**

- ربط **phpmyadmin** مع **laravel** نذهب الى برنامج **xampp** ونعمل قاعدة بيانات جديدة باسم مثلا **platformiq**

- ثم نذهب الى **privileges** لتكوين حساب جديد لقاعدة البيانات التي قمت بأنشأهها عن طريق الذهاب الى **add user account**

الآن قمنا بإدخال اسم ورمز المرور الجديد وهو **rahmaaltaee/12345** لقاعدة البيانات كما موضح في لقطة الشاشة

User name	Host name	Type	Privileges	Grant	Action
<input type="checkbox"/> rahmaaltaee	localhost	global	ALL PRIVILEGES	Yes	 Edit privileges
<input type="checkbox"/> root	127.0.0.1	global	ALL PRIVILEGES	Yes	 Edit privileges
<input type="checkbox"/> root	::1	global	ALL PRIVILEGES	Yes	 Edit privileges
<input type="checkbox"/> root	localhost	global	ALL PRIVILEGES	Yes	 Edit privileges

★ للتأكد من ان **laravel** يعمل نكتب هذا الامر **php artisan serve**

3- بعد ذلك دخل الى ملف `platformiq` ثم ملف `env` ونقوم بتعديل `platformiq` و `database` و `username` و `password` الى نفس الاسم والرمز الذي وضعناه في قاعدة البيانات أعلاه.

```
DB_CONNECTION=mysql
DB_HOST=127.0.0.1
DB_PORT=3306
DB_DATABASE=platformiq
DB_USERNAME=rahmaaltaee
DB_PASSWORD=12345
```

4- بعد تكوين قاعدة البيانات `platformiq` نذهب الى ملف `platformiq` ثم ملف `migrations` ثم ملف `database`

فلاحظ وجود ملفين خاصية: **الأول** `users` لخلق وانشاء مستخدمين **والثاني** `password_resets` لاعادة ضبط كلمة المرور كما موضح بالقطة الشاشة

	2014_10_12_000000_create_users_table	٢٠١٤/١٠/١٢ ٠٩:٥٠ م	٧:٣٦	PHP File
	2014_10_12_100000_create_password_rese...	٢٠١٤/١٠/١٢ ٠٩:٥٠ م	٧:٣٦	PHP File

★ نكتب الامر `php artisan make:auth` في cmd

```
C:\xampp\htdocs\platformiq>php artisan make:auth
Authentication scaffolding generated successfully.
```

5- ندخل الى ملف الأساسي `platformiq` ثم ملف `Http` ثم ملف `app` ثم ملف `platformiq` تلاحظ وجود ملف جديد اسمه `Auth` فيه مجموعة من الملفات وهي:

	ForgotPasswordController	٢٠١٤/٠٩/٠٥ ٠٧:٣٦ م	PHP File
	LoginController	٢٠١٤/٠٩/٠٥ ٠٧:٣٦ م	PHP File
	RegisterController	٢٠١٤/٠٩/٠٥ ٠٧:٣٦ م	PHP File
	ResetPasswordController	٢٠١٤/٠٩/٠٥ ٠٧:٣٦ م	PHP File
	VerificationController	٢٠١٤/٠٩/٠٥ ٠٧:٣٦ م	PHP File

نكتب امر تشغيل السيرفر مرة اخرى وهو `php artisan serve`  
ثم نذهب الى متجر الانترنت مثل **google chrome** ونكتب فيه الرابط الاتي  
`register` و `login` نلاحظ ظهور <http://localhost:8000>

اذا ذهبنا الى ملف `auth` ثم ملف `views` ثم ملف `resources` ثم ملف `platformiq` ثم ملف `register` و `login` الذي ظهر في الصفحة الرئيسية أعلاه وكما موضح بالصورة.

	<code>passwords</code>	٢٠١٤/١٠/٨ ص ٣٣	File folder
	<code>login.blade</code>	٢٠١٤/١٠/٨ ص ٣٣	PHP File
	<code>register.blade</code>	٢٠١٤/١٠/٨ ص ٣٣	PHP File
	<code>verify.blade</code>	٢٠١٤/١٠/٨ ص ٣٣	PHP File

## Laravel-Tables

نقوم بـ**إنشاء جدول داخل قاعدة البيانات من خلال كتابة الامر** `php artisan migrate`

```
C:\xampp\htdocs\platformiq>php artisan migrate
Migration table created successfully.
Migrating: 2014_10_12_000000_create_users_table
Migrated: 2014_10_12_000000_create_users_table (0.33 seconds)
Migrating: 2014_10_12_100000_create_password_resets_table
Migrated: 2014_10_12_100000_create_password_resets_table (0.45 seconds)
```

فلاحظ تم انشاء جداول جديدة في قاعدة البيانات وفي ملف `migrations` وتمت العملية بنجاح ☺

فلاحظ وجود الجدول في قاعدة البيانات كما موضح بالقطة الشاشة:

Table	Action
migrations	<a href="#">Browse</a> <a href="#">Structure</a> <a href="#">Search</a> <a href="#">Insert</a> <a href="#">Empty</a> <a href="#">Drop</a>
password_resets	<a href="#">Browse</a> <a href="#">Structure</a> <a href="#">Search</a> <a href="#">Insert</a> <a href="#">Empty</a> <a href="#">Drop</a>
users	<a href="#">Browse</a> <a href="#">Structure</a> <a href="#">Search</a> <a href="#">Insert</a> <a href="#">Empty</a> <a href="#">Drop</a>
3 tables	<a href="#">Sum</a>

الآن نعمل تسجيل دخول جديد نذهب الى **register** ونقوم بادخال اسم مثلا **Rahma** ورمز الدخول مثلا **12345678**

Register

Name	<input type="text" value="Rahma"/>
E-Mail Address	<input type="text" value="RahmaLabib@gmail.com"/>
Password	<input type="password" value="*****"/>
Confirm Password	<input type="password" value="*****"/>
<input type="button" value="Register"/>	

نضغط على **Register** فتظهر لنا

Dashboard

You are logged in!

تم تسجيل الدخول بنجاح

وتم إضافة الاسم الى قاعدة البيانات

<a href="#">id</a>	<a href="#">name</a>	<a href="#">email</a>	<a href="#">email_verified_at</a>	<a href="#">password</a>	<a href="#">remember_token</a>	<a href="#">created_at</a>	<a href="#">updated_at</a>
1	Rahma	RahmaLabib@gmail.com	NULL	\$2y\$10\$6wvj8NEYxV7tNA3ymmzTxu.qojulrcNoDqza.f5L198...	NULL	2020-09-07 22:20:50	2020-09-07 22:20

## Laravel-model

يجب ان نقوم بإنشاء **model** وذلك لكي نستطيع الوصول الى **database** وفا تكون عن طريق **model** من خلال كتابة الامر التالي:

```
php artisan make:model post -m
```

هو اسم الموديل المراد انشاءه في قاعدة البيانات ويكون دائماً مفرد.  
**post** - لعمل جدول في قاعدة البيانات باسم **post**

```
C:\xampp\htdocs\platformiq>php artisan make:model post -m
Model created successfully.
Created Migration: 2020_09_07_232951_create_posts_table
```

وبنفس الطريقة أعلاه نقوم بإضافة موديل ثاني باسم **Category**

فلاحظ داخل ملف **platformiq /database/migrations** قام بإضافة ملف الذي قمنا بإنشائه **Categories , posts**

- 2014\_10\_12\_000000\_create\_users\_table
- 2014\_10\_12\_100000\_create\_password\_rese...
- 2020\_09\_07\_232951\_create\_posts\_table
- 2020\_09\_08\_000313\_create\_categories\_table

ونكتب في **create\_posts\_table** الحقول التي تحتاجها للمشروع كما في الكود التالي:

```
<?php

use Illuminate\Support\Facades\Schema;
use Illuminate\Database\Schema\Blueprint;
use Illuminate\Database\Migrations\Migration;
class CreatePostsTable extends Migration
{
    public function up()
    {
        Schema::create('posts', function (Blueprint $table) {
            $table->bigIncrements('id');
            $table->string('title');
            $table->string('content');
            $table->string('category_id');
            $table->string('featrured');
            $table->timestamps();
        });
    }
}
```

```

    }
    public function down()
    {
        Schema::dropIfExists('posts');
    }
}

```

و عندما نذهب الى ملف **platformiq /app** نلاحظ تم انشاء ملف موديل **post** و **category**

الآن نقوم بربط ملف **post** مع ملف **category** فندخل الى ملف **post.php** ونقوم بكتابة الكود الموجود داخل المستطيل :

```

<?php

namespace App;

use Illuminate\Database\Eloquent\Model;

class post extends Model
{
    public function category()
    {
        return $this->belongsTo('App\Category');
    }
}

```

وندخل الى ملف الموديل **category.php** ونقوم بكتابة الكود الموجود داخل المستطيل :

```

<?php

namespace App;

use Illuminate\Database\Eloquent\Model;

class Category extends Model
{
    public function posts()
    {
        return $this->hasMany('App\Post');
    }
}

```

## Laravel-Controller+web

لكي نقوم بعرض الشغل على المستخدم نقوم بإنشاء **controller** الذي يمثل حلقة وصل بين **view** وبين **model**

من خلال كتابة الامر التالي في cmd

```
php artisan make:controller postsController --resource
```

```
C:\xampp\htdocs\platformiq>php artisan make:controller postsController --resource
Controller created successfully.
```

تم انشاء ملف **postsController** في ملف **platformiq /Http/controllers**

```
Auth
Controller
HomeController
postsController
```

ندخل الى الملف السابق

**platformiq /app/Http/controllers/postsController.php**

ونقوم بإضافة الكود التالي في **:public function create**

```
<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;

class postsController extends Controller
{

    public function index()
    {

    }

    public function create()
    {
        return view('posts.create');
    }
}
```

في ملف **posts** نقوم بإنشاء ملف نسمية مثلا **platformiq /resources/views create.blade.php** ونعمل داخله ملف اسمه

**ملاحظة:** نقوم بكتابه **blade.php** لكي نستطيع ان نستخدم (`@extends('layouts.app')`

التي سوف نشرحها فيما بعد

ثم نكتب الكود التالي داخل ملف **Create.blade.php**

```
@extends('layouts.app')

@section('content')
<div class="container">
<div class="row justify-content-center">
<div class="col-md-8">
<div class="card">
<div class="card-header">Create Post</div>
<div class="card-body">

Create your Post :)
</div>
</div>
</div>
</div>
</div>
@endsection
```

## Laravel- Web

ندخل الى ملف **platformiq /routes/web.php** ونكتب فيه هذا الكود لكي نعرض  
الشغل على السيرفر:

```
<?php

Route::get('/', function () {
    return view('welcome');
});

Auth::routes();

Route::get('/home', 'HomeController@index')->name('home');

Route::get('/post/create', 'PostsController@create')
->name('post.create');
```

بعد كتابة الاكواد أعلاه نذهب الى متصفح الانترنت مثل **google chrome** ونكتب الرابط  
<http://localhost:8000/post/create> الاتي :

فقط هر لنا هذه الصفحة :

Create Post
Create your Post :)

أي ان التسجيل تم بنجاح

## Laravel-Navbar-Posts

★ الان نعمل في **posts** قائمة منسلقة وهي **navbar** فنذهب الى ملف:  
ندخل الى ملف **platformiq /resources/views/layouts/app.blade.php**

نكتب فيه الكود التالي:

```
<body>
<div id="app">
<nav class="navbar navbar-expand-md navbar-light bg-white shadow-sm">
<div class="container">
<a class="navbar-brand" href="{{ url('/') }}>
    Rahma altaee
</a>
<ul class="navbar-nav mr-auto">

<li class="nav-item dropdown">
<a class="nav-link dropdown-toggle" href="#" id="navbarDropdown" role="button" data-toggle="dropdown" aria-haspopup="true" aria-expanded="false">
    Posts
</a>
<div class="dropdown-menu" aria-labelledby="navbarDropdown">
<a class="dropdown-item" href="{{ route('post.create') }}>Create</a>
<a class="dropdown-item" href="#">Another action</a>
<div class="dropdown-divider"></div>
<a class="dropdown-item" href="#">Something else here</a>
</div>
</li>
</ul>
</div>
```

بعد كتابة الاكواد أعلاه نذهب الى متصفح الانترنت مثل google chrome ونكتب الرابط  
<http://localhost:8000/home>

يظهر لنا navbar كما موضح بلقطة الشاشة:

لكي نستطيع فتح الصفحة على متتصف السيرفر نضيف هذا الكود في ملف

## platformiq /routes/web.php

```
<?php

Route::get('/', function () {
    return view('welcome');
});

Auth::routes();

Route::get('/home', 'HomeController@index')->name('home');

Route::group(['middleware'=>'auth'], function () {
    //route for posts

    Route::get('/post/create', 'PostsController@create')->name
    ('post.create');

});
```

نقوم بتنزيل ckeditor من خلال الذهاب الى موقع

<https://github.com/UniSharp/laravel-ckeditor>

تم نكتب في cmd الامر التالي لتنزيل ckeditor في laravel

`composer require unisharp/laravel-ckeditor`

ثم الامر `php artisan vendor:publish --tag=ckeditor`

نذهب الى ملف platformiq/public/vendor ckeditor نلاحظ وجود ملف

`platformiq/resources/views/posts/create.blade.php` نكتب الكود

: التالي

```
@extends('layouts.app')

@section('content')

Create Post

<form action="{{ route('post.store') }}" method="POST">
    {{ csrf_field() }}
    <div class="form-group">
        <label for="title">Title</label>
        <input type="text" class="form-control" name="title"
placeholder="Enter title">
    </div>
    <div class="form-group">

```

```

<label for="content">Description</label>
<textarea class="form-control" name="content" id="content" rows="8"
cols="8"></textarea>
</div>
<div class="form-group">
<label for="featured">Photo</label>
<input type="file" class="form-control-file" name="featured">
</div>
<button type="submit" class="btn btn-primary">Save</button>
</form>
</div>
</div>
</div>
</div>
</div>
</div>
@endsection
@section('scripts')
<script src="http://cdnjs.cloudflare.com/ajax/libs/summernote/0.8.2/summernote.js" defer></script>

<script src="http://cdnjs.cloudflare.com/ajax/libs/jquery/3.2.1/jquery.js"></script>
<script>
$(document).ready(function() {
    $('#content').summernote();
});
</script>

```

@endsection

داخل المستطيل أعلاه كود ckeditor

بعد كتابة الأكواد أعلاه فنضغط على **posts create** كما موضح بالقطة الشاشة:

فقط يظهر لنا هذه الصفحة كما موضح بلقطة الشاشة:

Create Post

Category

Tag Heuer

Tag  
 Germany

Title

Enter title

Description

Photo

Choose File No file chosen

Save

التحقق من ملئ حقول **posts** السابقة عند الضغط على **save** سوف ترسل هذه البيانات الى قاعدة البيانات فنذهب الى ملف:

**platformiq /resources/views/posts/create.blade.php**

```
@extends('layouts.app')

@section('content')

Create Post

@if(count($errors)>0)

@foreach($errors->all() as $error )
- {{ $error }}

@endforeach

@endif

```

```

</ul>
@endif

</div>
</div>
</div>
</div>
</div>
@endsection
@section('scripts')

<script
src="http://cdnjs.cloudflare.com/ajax/libs/summernote/0.8.2/summernote.js" defer></script>

<script
src="http://cdnjs.cloudflare.com/ajax/libs/jquery/3.2.1/jquery.js"></script>
<script>
$(document).ready(function() {
    $('#content').summernote();
});
</script>

@endsection

```

اذا لم نقوم بملئ الحقول بالبيانات ثم نضغط على **save** تظهر كما واضح بلقطة الشاشة:

The screenshot shows a 'Create Post' form with three error messages at the top:

- The title field is required.
- The content field is required.
- The featured field is required.

Below the errors, there are two input fields:

- Title**: A text input field with the placeholder "Enter title".
- Description**: A text input field.

ثم ندخل الى ملف **platformiq/routes/web.php** ونكتب الكود التالي لكي تتنقل البيانات الى صفحة **/post/store** عند الضغط على **save**

```

<?php

Route::get('/', function () {
return view('welcome');
});

Auth::routes();

Route::get('/home', 'HomeController@index')->name('home');

```

```

Route::group(['prefix' => 'user', 'middleware' => 'auth'], function () {
    //Route::group(['middleware' => 'auth'], function () {
        //route for posts
        Route::get('/post/create', 'PostsController@create')->name('post.create');
        Route::post('/post/store', 'PostsController@store')->name('post.store');
    });
});

```

ولحساب عدد **posts** في قائمة **error** نكتب الكود التالي في ملف :

## platformiq /app/Http/controllers/postsController.php

ونكتب الكود التالي في **public function stroe**

```

<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;

class postsController extends Controller
{

    public function index()
    {

    }

    public function create()
    {
        return view('posts.create');
    }
}

```

```

public function store(Request $request)
{
    $this->validate($request, [
        "title" => "required",
        "content" => "required",
        "featured" => "required|image",
    ]);
    dd($request->all());
}

```

بعد ذلك نقوم بملئ الحقول بالبيانات ثم نضغط على **save** فتظهر كالاتي وذلك بسبب استخدامنا لهذا الكود

```
dd($request->all());
```

```

array:4 [▼
    "_token" => "VfTLyKDIdbQAIgi3v3JJQXhzK3nyZ3abzxBS38ZI"
    "title" => "this is title"
    "content" => "this message this message this message this message this message this message"
    "featured" => Illuminate\UploadedFile {#251 ▶}
]

```

## Laravel-Navbar-Categories

نعمل في **navbar** قائمة منسلقة ثانية وهي **categories** فنذهب الى ملف:  
**platformiq /resources/views/posts/category.blade.php**

نكتب الكود التالي:

```
@extends('layouts.app')

@section('content')

Category Post

{{ csrf_field() }}

Name

Save

```

بعد كتابة الاكواد أعلاه فنضغط على **create** من قائمة **categories** كما موضح :

### Create Category

---

Name

Save

# Laravel-Controller

ثم نقوم بإنشاء controller `posts` كما عملنا سابقاً مع `cmd` فنقوم بكتابة الامر التالي في `categoriesController`

```
php artisan make:controller categoriesController --resource
```

```
C:\xampp\htdocs\platformiq>php artisan make:controller categoriesController --resource  
Controller created successfully.
```

C:\xampp\htdocs\platformiq>

بعدها نفتح هذا الملف فنذهب الى ملف:

## platformiq /app/Http/controllers/categoriesController.php

: public function create في الكود التالي نكتب

```
<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
class categoriesController extends Controller
{
    public function index()
    {
        //
    }
    public function create()
    {
        return view('categories.create');
    }
}
```

التحقق من ملئ حقول **category** السابقة عند الضغط على **save** سوف ترسل هذه البيانات الى قاعدة البيانات فنذهب الى ملف:

**platformiq /resources/views/posts/category.blade.php**

```
@extends('layouts.app')

@section('content')

<div class="container">
<div class="row justify-content-center">
<div class="col-md-8">
<div class="card">
<div class="card-header">Category Post</div>

<div class="card-body">
@if(count($errors)>0)
<ul class="navbar-nav mr-auto">
@foreach($errors->all() as $error )
<li class="nav-item active">
{{$error}}
</li>
@endforeach
</ul>
@endif
</div>
</div>
</div>
</div>
</div>
@endsection
```

اذا لم نقوم بملئ الحقول بالبيانات ثم نضغط على **save** تظهر كما واضح بلقطة الشاشة:

The screenshot shows a 'Create Category' form. At the top, it says 'Create Category'. Below that, there is an error message: 'The name field is required.' Underneath the error message is a 'Name' input field, which is currently empty. Below the input field is a placeholder text 'Enter title'. At the bottom of the form is a blue 'Save' button.

## Laravel-Web

ثم ندخل الى ملف **platformiq /routes/web.php** ونكتب الكود التالي لكي تتنقل البيانات الى صفحة **/category/store** عند الضغط على **save**

```
<?php

Route::get('/', function () {
    return view('welcome');
});

Auth::routes();

Route::get('/home', 'HomeController@index')->name('home');

Route::group(['prefix' => 'user', 'middleware'=>'auth'], function ()
{
//Route::group(['middleware'=>'auth'], function () {

    //route for posts
    Route::get('/post/create', 'PostsController@create')-
>name('post.create');
    Route::post('/post/store', 'PostsController@store')-
>name('post.store');

    //route for Categories
    Route::get('/category/create', 'CategoriesController@create')-
>name('category.create');
    Route::post('/category/store', 'CategoriesController@store')-
>name('category.store');
});
```

ولحساب عدد **category** في قائمة **error** نكتب الكود التالي في ملف :  
**platformiq /app/Http/controllers/categoriesController.php**

ونكتب الكود التالي في **public function stroe**

```
<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;

class categoriesController extends Controller
{
    public function index()
```

```

    {
}

public function create()
{
    return view('categories.create');
}

public function store(Request $request)
{
    $this->validate($request, [
        'name' => 'required'
    ]);
    dd($request->all());
}

```

بعد ذلك نقوم بملئ الحقول بالبيانات ثم نضغط على **save** فنظهر كالاتي وذلك بسبب استخدمنا لهذا الكود:

```

array:2 [▼
  "_token" => "VfTLyKDidbQAIgi3v3JJQXhzK3nyZ3abzxBS38Z1"
  "name" => "laravel"
]

```

ثم نكتب الامر: **php artisan categories -m**  
ونكتب فيه الكود التالي:

```

<?php

use Illuminate\Support\Facades\Schema;
use Illuminate\Database\Schema\Blueprint;
use Illuminate\Database\Migrations\Migration;

class CreateCategoriesTable extends Migration
{

    public function up()
    {
        Schema::create('categories', function (Blueprint $table) {
            $table->increments('id');
            $table->string('name');
            $table->timestamps();
        });
    }

    public function down()
    {
        Schema::dropIfExists('categories');
    }
}

```

## Laravel-Migrations

ثم نعمل **migration** لجدول **posts** و **categories** في قاعدة البيانات لكي تقوم هذه الجداول باستقبال البيانات المرسلة:

فنكتب الامر التالي في cmd :  
**php artisan migration**

```
C:\xampp\htdocs\platformiq>php artisan migrate
Migrating: 2020_09_07_232951_create_posts_table
Migrated: 2020_09_07_232951_create_posts_table (0.91 seconds)
Migrating: 2020_09_08_000313_create_categories_table
Migrated: 2020_09_08_000313_create_categories_table (0.29 seconds)
```

فنذهب الى قاعدة البيانات نلاحظ انه قام بعمل جدولين هما **post** , **category**

ثم نذهب الى ملف **platformiq/routes/web.php** ونعمل **categories** ونقوم بإضافة الكود التالي:

```
<?php

//route for Categories
Route::get('/categories', 'CategoriesController@index')-
>name('categories');
Route::get('/category/create', 'CategoriesController@create')-
>name('category.create');
Route::post('/category/store', 'CategoriesController@store')-
>name('category.store');

});
```

## Laravel-Database

خزن البيانات في DATABASE في ملف  
[platformiq/app/http/controllers/categoriescontroller](https://platformiq/app/http/controllers/categoriescontroller)

ونكتب الكود التالي في public function create

```
<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\Category;
class categoriesController extends Controller
{

public function index()
{
return view('categories.index')->with('categories',Category::all());
}

public function create()
{
}

}
```

ثم نقوم الان بإدخال البيانات لكي نرسلها الى database

Create Category

Name

Tag Heuer

Save

نذهب الى قاعدة البيانات ونلاحظ تم ارسال وختن البيانات في قاعدة البيانات كما موضح بالقطة الشاشة:

<b>id</b>	<b>name</b>	<b>created_at</b>	<b>updated_at</b>
1	Tag Heuer	2020-09-22 22:11:01	2020-09-22 22:11:01
2	Omega	2020-09-22 22:11:19	2020-09-22 22:11:19
3	Rolex	2020-09-22 22:20:59	2020-09-22 22:20:59
4	Breitling	2020-09-22 22:21:21	2020-09-22 22:21:21

## Laravel-Data retrieval

استرجاع البيانات من قاعدة البيانات وعرضها في جدول لكي نرى كم category عملنا:

أولاً : نقوم بعمل صفحة index

في ملف platformiq/resources/views/categories/index.blade.php

ونكتب الكود التالي:

```
@extends('layouts.app')

@section('content')

Categories

| No                     | Edit                                                                                                                                                                                             | Delete                                                                                                                                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {{ \$category->name }} | <a class="" href="{{ route('category.edit', ['id' =&gt;\$category-&gt;id ]) }}">  </a> | <a class="" href="{{ route('category.delete', ['id' =&gt;\$category-&gt;id ]) }}">  </a> |

 laravel

~ 37 ~

```

ثانياً: نذهب الى ملف

## platformiq /app/Http/controllers/categoriesController.php

ونكتب الكود التالي في public function index :

```
namespace App\Http\Controllers;

use Illuminate\Http\Request;
//use App\Category;
use App\Category;
class categoriesController extends Controller
{

public function index()
{
    return view('categories.index')-
>with('categories',Category::all());
}
```

ثالثاً: نذهب الى ملف :

## platformiq/resources/views/layouts/app.blade.php

ونضيف الكود التالي:

```
<!DOCTYPE html>
<html lang="{{ str_replace('_', '-', app()>getLocale()) }}>
<head>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1">
<meta name="csrf-token" content="{{ csrf_token() }}>

<title>{{ config('app.name', 'Laravel') }}</title>
<script src="{{ asset('js/app.js') }}" defer></script>
<link rel="dns-prefetch" href="//fonts.gstatic.com">
<link href="https://fonts.googleapis.com/css?family=Nunito" rel="stylesheet">
<link href="{{ asset('css/app.css') }}" rel="stylesheet">
</head>
<body>
<div id="app">
<nav class="navbar navbar-expand-md navbar-light bg-white shadow-sm">
<div class="container">
<a class="navbar-brand" href="{{ url('/') }}>
Rahma altaee
</a>
<ul class="navbar-nav mr-auto">
<li class="nav-item dropdown">
<a class="nav-link dropdown-toggle" href="#" id="navbarDropdown" role="button" data-toggle="dropdown" aria-haspopup="true" aria-expanded="false">
Category
</a>
<div class="dropdown-menu" aria-labelledby="navbarDropdown">
<a class="dropdown-item"
href="{{ route('category.create') }}>Create</a>
<a class="dropdown-item"
href="{{ route('categories') }}>Categories</a>
<div class="dropdown-divider"></div>
<a class="dropdown-item" href="#">Something else here
```

```
</div>
</li></ul>
```

Category ▾ Posts ▾

فذهب الى قائمة categories ونضغط على category

فيظهر لنا الجدول كما موضح ادناه لاسترجاع البيانات:

No	Edit	Delete
Tag Heuer		
Omega		
Rolex		
Breitling		

فلاحظ تم استرجاع وعرض البيانات بنجاح 😊

رابعاً: نقوم بعمل edit , delete بنفس الشكل مع ملف

[platformiq/routes/web.php](#)

```
<?php
Route::get('/', function () {
    return view('welcome');
});

Auth::routes();

//route for Categories
Route::get('/categories', 'CategoriesController@index')-
>name('categories');
    Route::get('/category/edit/{id}', 'CategoriesController@edit')-
>name('category.edit');
```

```

        Route::get('/category/delete/{id}', 'CategoriesController@destroy')->name('category.delete');
        Route::get('/category/create', 'CategoriesController@create')->name('category.create');
        Route::post('/category/store', 'CategoriesController@store')->name('category.store');
        Route::post('/category/update/{id}', 'CategoriesController@update')->name('category.update');

    });

}

```

## Laravel-Controller

[platformiq/app/http/controllers/categorycontroller](#) وبعدها ملف

في public function edit , update,destroy

```

<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\Category;

class CategoriesController extends Controller
{
    public function index()
    {
        return view('categories.index')->with('categories',Category::all());
    }

    public function create()
    {
        return view('categories.create');
    }

    public function store(Request $request)
    {
        $this->validate($request, [
            'name' => 'required'
        ]);

        $category = new Category;

        $category->name = $request->name;
        $category->save();

        return redirect()->back();
    }

    public function show($id)
    {

```

```

    }

    public function edit($id)
    {
        $category = Category::find($id);
        return view('categories.edit')->with('category', $category);
    }

    public function update(Request $request, $id)
    {
        $category = Category::find($id);
        $category->name = $request->name;
        $category->save();
        return redirect()->route('categories');

    }
    public function destroy($id)
    {
        $category = Category::find($id);
        foreach ($category->posts as $post) {
            $post->forceDelete();
        }
        $category->delete();
        return redirect()->route('categories');
    }
}

```

والآن نقوم نعمل صفحة **delete** في ملف:

## Platformiq/resources/views/categories/edit.blade.php

فندخل الى الصفحة أعلاه ونكتب الكود التالي:

```

@extends('layouts.app')

@section('content')

Edit Category {{ $category->name }}

<form action="{{ route('category.update', ['id' => $category->id]) }}" method="POST" >
{{ csrf_field() }}
<div class="form-group">
<label for="name">Name</label>
<input type="text" class="form-control" name="name" value="{{ $category->name }}>
</div>
<button type="submit" class="btn btn-primary">Update</button>
</form>
</div>
</div>
</div>
</div>

```

فبعد الضغط على edit تظهر لنا هذه الصفحة:

Edit Category Tag Heuer

Name

Tag Heuer

Update

و عند الضغط على delete على مثلا TagHeuer نلاحظ تم حذفة كما موضح بلقطة الشاشة:

Categories		
No	Edit	Delete
Omega		

## Laravel-Data retrieval

لجلب مع البيانات نذهب الى ملف  
**platform/app/http/controllers/postscontroller.php**

ونكتب الكود في **public function store**

```
<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\Category;
class postsController extends Controller
{

    public function index()
    {
        return view('posts.index')->with('posts', Post::all());
    }

    public function create()
    {
        return view('posts.create')->with('categories', category::all());
    }
}
```

```

public function store(Request $request)
{
    $this->validate($request, [
        "title"      => "required",
        "content"    => "required",
        "category_id" => "required",
        "featured"   => "required|image",
    ]);
}

```

فيعرض في صفحة create post كما موضح أدناه:

Create Post

Category

Omega

- Omega**
- Rolex
- Breitling
- Patek Philippe
- Fordeal

Enter title

## Laravel-photo

رفع الصور وخرزها في قاعدة البيانات + عمل soft delete at لاخفاء البيانات عند حذفها من قبل المستخدم فندخل الى ملف:

<platformiq/app/http/controllers/postcontroller.php>

ونكتب الكود في public function store

```

<?php

namespace App\Http\Controllers;
use Illuminate\Http\Request;
use App\Category;
use App\Post;

class postsController extends Controller
{

    public function store(Request $request)
    {
        $this->validate($request, [
            "title"      => "required",
            "content"    => "required",
            "category_id" => "required",
            "featured"   => "required|image"
        ]);

        $featured = $request->featured;
    }
}

```

```

$featured_new_name = time() . $featured-
>getClientOriginalName();
$featured->move('uploads/posts', $featured_new_name);
$post = Post::create([
    "title"      => $request->title,
    "content"    => $request->content,
    "category_id" => $request->category_id,
    "featrueed"  => 'uploads/posts/' . $featured_new_name
]);
return redirect()->back();
}

```

وملف **platformiq/app/post.php** ونكتب الكود التالي:

```

<?php

namespace App;

use Illuminate\Database\Eloquent\Model;
use Illuminate\Database\Eloquent\SoftDeletes;

class Post extends Model
{
    use SoftDeletes;

    protected $fillable = [
        'title', 'content', 'category_id', 'featrueed', 'slug'
    ];

    protected $dates = ['deleted_at'];

    public function category()
    {
        return $this->belongsTo('App\Category');
    }
}

```

ثم نذهب الى قاعدة البيانات نلاحظ تم انشاء حقل للصور وتم خزنها هناك

ID	Title	Content	Category ID	Featured	Slug	Deleted At	Created At	Updated At
1	Iraq	Lorem ipsum is simply dummy text of the printing industry.	5	uploads/posts/1601061430omega1.jpg	this-is-title	NULL	2020-09-25 16:39:18	2020-09-25 19:11
2	Turkey	Lorem ipsum is simply dummy text of the printing industry.	4	uploads/posts/1601061387rolx.jpg	some-title	NULL	2020-09-25 16:40:27	2020-09-25 19:16
3	France	Lorem ipsum is simply dummy text of the printing industry.	1	uploads/posts/160106394100.jpg	omer	NULL	2020-09-25 18:43:45	2020-09-25 19:56
4	Russia	Lorem ipsum is simply dummy text of the printing industry.	3	uploads/posts/1601063972pat.jpg	rahma	NULL	2020-09-25 18:44:38	2020-09-25 19:56
5	Germany	Lorem ipsum is simply dummy text of the printing industry.	1	uploads/posts/1601063920fordel.jpg	germany	NULL	2020-09-25 19:13:27	Activate Windows Go to Settings to activate Windows.

ونعمل ملف `platformiq/public/update/posts` في ملف `update/posts` نلاحظ تم خزن الصورة في هذا ال folder

 1600643503IMG_201...	٢٠١٩/١١/٢٨ م ١٠:٣٩	JPG File	125 KB
 1600813044tagheuer2	٢٠٢٠/٠٩/٢١ ص ١٠:٤٧	JPG File	131 KB

 1600815490tagheuer3	٢٠٢٠/٠٩/٢١ ص ١٠:٥٨	JPG File	87 KB

## Laravel-Slug

عمل slug لخزن title في قاعدة البيانات

نذهب الى ملف `platformiq/app/controllers/postscontroller`:

ونكتب الكود التالي:

```
<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\Category;
use App\Post;
public function store(Request $request)
```

```

{
    $this->validate($request, [
        "title"      => "required",
        "content"    => "required",
        "category_id" => "required",
        "featured"   => "required|image",
    ]);

    $featured = $request->featured;
    $featured_new_name = time().$featured->getClientOriginalName();
    $featured->move('uploads/posts', $featured_new_name);
    $post = Post::create([
        "title"      => $request->title,
        "content"    => $request->content,
        "category_id" => $request->category_id,
        "featruded"  => 'uploads/posts/' . $featured_new_name,
        "slug"       => str_slug($request->title) // my new post => my-new-
    ]);
    return redirect()->back();
}

```

ثم ملف platformiq/app/post.php ونكتب هذا الكود:

```

<?php

namespace App;

use Illuminate\Database\Eloquent\Model;
use Illuminate\Database\Eloquent\SoftDeletes;

class Post extends Model
{
    use SoftDeletes;

    protected $fillable = [
        'title', 'content', 'category_id', 'featruded', 'slug'
    ];

    protected $dates = ['deleted_at'];
}

```

وبعد ذلك نقوم بعمل حقل slug داخل قاعدة البيانات فندخل الى ملف Platformiq/database/migrations/ 2020\_09\_07\_232951\_create\_posts\_table

ونكتب الكود التالي:

```

<?php

use Illuminate\Support\Facades\Schema;
use Illuminate\Database\Schema\Blueprint;
use Illuminate\Database\Migrations\Migration;

```

```

class CreatePostsTable extends Migration
{
    public function up()
    {
        Schema::create('posts', function (Blueprint $table) {
            $table->bigIncrements('id');
            $table->string('title');
            $table->string('content');
            $table->string('category_id');
            $table->string('featrueed');
            $table->string('slug');
            $table->softDeletes();
        });
    }
}

```

ونذهب الى قاعدة البيانات نلاحظ تم انشاء حقل `slug` وفيه نفس بيانات `title`

<code>id</code>	<code>title</code>	<code>content</code>	<code>category_id</code>	<code>featrueed</code>	<code>slug</code>	<code>deleted_at</code>	<code>created_at</code>	<code>updated_at</code>
1	Iraq	Lorem ipsum is simply dummy text of the printing ~	5	uploads/posts/1601061430omega1.jpg	this-is-title	NULL	2020-09-25 16:39:18	2020-09-25 19:17

نعمل في القائمة المنسللة `posts` كما في `categories` ملـف في قائمة `posts` لـاضافة `posts` في `app.blade.php`

```

<!DOCTYPE html>
<html lang="{{ str_replace('_', '-', app()>getLocale()) }}>
<head>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1">

<!-- CSRF Token -->
<meta name="csrf-token" content="{{ csrf_token() }}>

<title>{{ config('app.name', 'Laravel') }}</title>

<!-- Scripts -->
<script src="{{ asset('js/app.js') }}" defer></script>

<!-- Fonts -->
<link rel="dns-prefetch" href="//fonts.gstatic.com">
<link href="https://fonts.googleapis.com/css?family=Nunito" rel="stylesheet">

<!-- Styles -->
<link href="{{ asset('css/app.css') }}" rel="stylesheet">
</head>
<body>
<div id="app">
<nav class="navbar navbar-expand-md navbar-light bg-white shadow-sm">
<div class="container">
<a class="navbar-brand" href="{{ url('/') }}>
Rahma altaee
</a>

```

```

<ul class="navbar-nav mr-auto">
<li class="nav-item dropdown">
<a class="nav-link dropdown-toggle" href="#" id="navbarDropdown"
role="button" data-toggle="dropdown" aria-haspopup="true" aria-
expanded="false">
Categories
</a>
<div class="dropdown-menu" aria-labelledby="navbarDropdown">
<a class="dropdown-item"
href="{{ route('category.create') }}">Create</a>
<a class="dropdown-item"
href="{{ route('categories') }}">Categories</a>

<div class="dropdown-divider"></div>
<a class="dropdown-item" href="#">Something else here</a>
</div>
</li>

</ul>

<ul class="navbar-nav mr-auto">
<li class="nav-item dropdown">
<a class="nav-link dropdown-toggle" href="#" id="navbarDropdown"
role="button" data-toggle="dropdown" aria-haspopup="true" aria-
expanded="false">
Posts
</a>
<div class="dropdown-menu" aria-labelledby="navbarDropdown">
<a class="dropdown-item" href="{{ route('post.create') }}">Create</a>
<a class="dropdown-item" href="{{ route('posts') }}">Posts</a>

<div class="dropdown-divider"></div>
<a class="dropdown-item" href="#">Something else here</a>
</div>
</li>

</ul>
<button class="navbar-toggler" type="button" data-toggle="collapse"
data-target="#navbarSupportedContent" aria-
controls="navbarSupportedContent" aria-expanded="false" aria-
label="{{ __('Toggle navigation') }}>
<span class="navbar-toggler-icon"></span>
</button>

```

Posts ▾

لاسترجاع جدول **posts** الى جدول في الصفحة الرئيسية

ملف **web.php**

```

<?php

Route::get('/', function () {
    return view('welcome');
});

Auth::routes();

Route::get('/home', 'HomeController@index')->name('home');

Route::group(['prefix' => 'user', 'middleware' => 'auth'], function () {
//Route::group(['middleware' => 'auth'], function () {

    //route for posts
    Route::get('/posts', 'PostsController@index')->name('posts');

    Route::get('/post/create', 'PostsController@create')-
>name('post.create');
    Route::post('/post/store', 'PostsController@store')-
>name('post.store');
    Route::get('/post/delete/{id}', 'postsController@destroy')-
>name('post.delete');

```

وأيضا نقوم بحذفها من جدول الصفحة الرئيسية

ملف **postscontroller**

**public function index,destroy في**

```

<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\Category;
use App\Post;

class postsController extends Controller
{

    public function index()
    {
        return view('posts.index')->with('posts', Post::all());
    }

    public function destroy($id)
    {
        $post = Post::find($id);
        $post->delete($id);
        return redirect()->back();
    }
}

```

نعمل صفحة post في ملف index.php

`@extends('layouts.app')`

```

@section('content')

Posts

@if ($posts->count()>0)

| No                                                                                                                      | Title               | Delete                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------------------------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | {{ \$post->title }} |  <a class="" href="{{ route('post.delete', ['id' =&gt; \$post-&gt;id ]) }}">  </a> |

```

# Laravel-Posts-Softdelete

Posts

No	Title	Edit	Delete
	Iraq		
	Turkey		
	France		
	Russia		
	Germany		

نعمل **posts softdeleted** لـ **posts** وهو يقوم باسترجاع البيانات المحذوفة في جدول لكي يقوم المستخدم اما بحذفها نهائيا او استرجاعها وخرزتها في البيانات مرة أخرى:

فعمل **posts softdeleted** في قائمة **posts** فنذهب الى صفحة **posts softdeleted** ونكتب الكود التالي:

```
<!DOCTYPE html>
<html lang="{{ str_replace('_', '-', app()->getLocale()) }}>
<head>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1">
Posts
</a>
<div class="dropdown-menu" aria-labelledby="navbarDropdown">
<a class="dropdown-item" href="{{ route('post.create') }}>Create</a>
<a class="dropdown-item" href="{{ route('posts') }}>Posts</a>

<div class="dropdown-divider"></div>
<a class="dropdown-item" href="{{ route('post.trashed') }}>Posts
Softdeleted</a>
</div>
</li>

</ul>
```

```

<button class="navbar-toggler" type="button" data-toggle="collapse"
data-target="#navbarSupportedContent" aria-
controls="navbarSupportedContent" aria-expanded="false" aria-
label="{{ __('Toggle navigation') }}"
<span class="navbar-toggler-icon"></span>
</button>
</body>
</html>

```

كما في الصورة قمنا بحذف Switzerland مثلًا:

No	Title	Edit	Delete
	Germany		
	Breitling		
	Patek Philippe		

نعمل صفحة فنذهب الى ملف  
[platformiq/resources/views/posts/softdeleted.blade.php](#)

ونكتب الكود التالي:

```

@extends('layouts.app')

@section('content')

Posts soft deleted

@if ($posts->count()>0)

| No | Title | Restore                 | Delete                 |
|----|-------|-------------------------|------------------------|
|    |       | <a href="#">Restore</a> | <a href="#">Delete</a> |

@endif

```

```

<tr>
<th scope="row">
title }}" class="img-
thumbnail" width="100px" height="100px">

</th>
<th scope="row">{{ $post->title }}</th>

<td>
<a class="" href="{{ route('post.restore', ['id' =>$post->id ])}}>

</a>
</td>
<td>
<a class="" href="{{ route('post.hdelete', ['id' =>$post->id ])}}>

</a>
</td>
</tr>
@endforeach

@else
<p scope="row" class="text-center">No trashed posts</p>
@endif
</tbody>
</table>
</div>
</div>
</div>
</div>
</div>
@endsection

```

ثم ملف web.php ونكتب الكود التالي:

```

<?php

Route::get('/', function () {
    return view('welcome');
});

Auth::routes();

Route::get('/home', 'HomeController@index')->name('home');

Route::group(['prefix' => 'user', 'middleware'=>'auth'], function ()
{
//Route::group(['middleware'=>'auth'], function () {

    //route for posts
    Route::get('/posts', 'PostsController@index')->name('posts');
    Route::get('/post/trashed', 'PostsController@trashed')-
>name('post.trashed');
    Route::get('/post/hdelete/{id}', 'PostsController@hdelete')-
>name('post.hdelete');

```

```

Route::get('/post/restore/{id}', 'PostsController@restore')-
>name('post.restore');

Route::get('/post/create', 'PostsController@create')-
>name('post.create');
Route::post('/post/store', 'PostsController@store')-
>name('post.store');
Route::get('/post/delete/{id}', 'postsController@destroy')-
>name('post.delete');

```

## platformiq/app/http/controllers/postscontroller

ثم ملف **platformiq/app/http/controllers/postscontroller**  
ونكتب الكود التالي:

```

<?php

namespace App\Http\Controllers;
use Illuminate\Http\Request;
use App\Category;
use App\Post;

class postsController extends Controller
{

    public function index()
    {
        return view('posts.index')->with('posts', Post::all());
    }

    public function create()
    {
        return view('posts.create')->with('categories', category::all());
    }

    public function store(Request $request)
    {
        $this->validate($request, [
            "title"      => "required",
            "content"    => "required",
            "category_id" => "required",
            "featured"   => "required|image",
        ]);

        $featured = $request->featured;
        $featured_new_name = time() . $featured-
>getClientOriginalName();
        $featured->move('uploads/posts', $featured_new_name);

        $post = Post::create([
            "title"      => $request->title,
            "content"    => $request->content,
            "category_id" => $request->category_id,
            "featrured"  => 'uploads/posts/' . $featured_new_name,
            "slug"       => str_slug($request->title) // my new post => my-new-
post
        ]);
        return redirect()->back();
    }
}

```

```

}

public function show($id)
{
}

public function edit($id)
{
// 
}

public function update(Request $request, $id)
{
}

public function destroy($id)
{
$post = Post::find($id);
$post->delete($id);
return redirect()->back();
}
public function trashed()
{
$post = Post::onlyTrashed()->get();
//dd($post);
return view('posts.softdeleted')->with('posts',$post);
}
public function hdelete($id)
{
$post = Post::withTrashed()->where('id',$id)->first();
$post->forceDelete();
return redirect()->back();
}
public function restore($id)
{
$post = Post::withTrashed()->where('id',$id)->first();
$post->restore();
return redirect()->route('posts');
}
}

```

فظهر كما في الصورة :

Posts soft deleted			
No	Title	Restore	Delete
	Iraq		

و عند الضغط على **delete** تزدف نهائيا

Posts soft deleted			
No trashed posts			

ولكن عند الضغط على **edit** ترجع الى صفحة **posts** لكي يقوم المستخدم بالتعديل عليها او بحذفها وتذهب الى صفحة **posts softdeleted** مرة أخرى: كما في الصورة السابقة:

## Laravel-update

التعديل على الصورة من قبل المستخدم في صفحة **posts** ملف **.blade.php**

```
@extends('layouts.app')

@section('content')

Posts

@if ($posts->count()>0)

| No | Title | Edit                 |
|----|-------|----------------------|
|    |       | <a href="#">Edit</a> |

@endif

```

```

<th scope="col">Delete</th>

</tr>
</thead>
<tbody>
@foreach ($posts as $post)
<tr>
<th scope="row">
title }}" class="img-
thumbnail" width="100px" height="100px">

</th>
<th scope="row">{{ $post->title }}</th>

<td>
<a class="" href="{{ route('post.edit', ['id' =>$post->id ])}}>

</a>
</td>
<td>
<a class="" href="{{ route('post.delete', ['id' =>$post->id ])}}>

</a>
</td>
</tr>
@endforeach

@else
<p scope="row" class="text-center">No posts</p>
@endif
</tbody>
</table>
</div>
</div>
</div>
</div>
</div>
@endif

```

نعمل ملف posts في ملف edit.php

```

@extends('layouts.app')

@section('content')

Edit Post {{ $posts->title }}

@if(count($errors)>0)

```

```

<ul class="navbar-nav mr-auto">
@foreach ($errors->all() as $error)
<li class="nav-item active">
{{$error}}
</li>
@endforeach

</ul>
@endif

<form action="{{route('post.update',['id' => $posts->id ])}}" method="POST" enctype="multipart/form-data">
{{ csrf_field() }}
<div class="form-group">
<label for="category_id">Category</label>
<select class="form-control" name="category_id" id="category">

@foreach ($categories as $category)
@if ($category->id == $posts->category_id)
<option value="{{ $category->id }}" selected>{{$category->name}}</option>
@else
<option value="{{ $category->id }}" >{{$category->name}}</option>
@endif

@endforeach

</select>
</div>
<div class="form-group">
<label for="title">Title</label>
<input type="text" class="form-control" name="title" value="{{ $posts->title }}">
</div>
<div class="form-group">
<label for="content">Description</label>
<textarea class="form-control" name="content" id="content" rows="8" cols="8">
{{ $posts->content }}
</textarea>
</div>
<div class="form-group">
<label for="featured">Photo</label>
<input type="file" class="form-control-file" name="featured">
</div>
<button type="submit" class="btn btn-primary">Update</button>
</form>

</div>
</div>
</div>
</div>
</div>
@endsection

```

## platformiq/app/http/controllers/postscontroller ملف

ونكتب في public function edit,update

```
<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\Category;
use App\Post;

class postsController extends Controller
{
}

public function show($id)
{
}

public function edit($id)
{
$post = Post::find($id);
return view('posts.edit')->with('posts', $post)
->with('categories', Category::all())-
>with('categories', category::all());
}

public function update(Request $request, $id)
{
$post = Post::find($id);

$this->validate($request, [
    "title"      => "required",
    "content"   => "required",
    "category_id"  => "required"
]);

if ( $request->hasFile('featured') ) {
    $featured = $request->featured;
    $featured_new_name = time().$featured-
>getClientOriginalName();
    $featured->move('uploads/posts/', $featured_new_name);
    $post->featruced = 'uploads/posts/'.$featured_new_name;
}

//dd($post);
$post->title = $request->title;
$post->content = $request->content;
$post->category_id = $request->category_id;
$post->save();
return redirect()->route('posts');
```

فی ملف web.php نكتب

```
}

<?php

Route::get('/', function () {
    return view('welcome');
});

Auth::routes();

Route::get('/home', 'HomeController@index')->name('home');

Route::group(['prefix' => 'user', 'middleware'=>'auth'], function ()
{
//Route::group([' middleware'=>'auth'], function () {

    //route for posts
    Route::get('/posts', 'PostsController@index')->name('posts');
    Route::get('/post/trashed', 'PostsController@trashed')-
>name('post.trashed');
    Route::get('/post/hdelete/{id}', 'PostsController@hdelete')-
>name('post.hdelete');
    Route::get('/post/restore/{id}', 'PostsController@restore')-
>name('post.restore');
    Route::get('/post/edit/{id}', 'PostsController@edit')-
>name('post.edit');
    Route::post('/post/update/{id}', 'PostsController@update')-
>name('post.update');

    Route::get('/post/create', 'PostsController@create')-
>name('post.create');
    Route::post('/post/store', 'PostsController@store')-
>name('post.store');
    Route::get('/post/delete/{id}', 'postsController@destroy')-
>name('post.delete');

}) ;
```

عند الضغط على عنصر في صفحة posts مثل نضغط على Germany

No	Title	Edit	Delete
	Germany		
	Breitling		
	Patek Philippe		

فسوف تحولنا الى صفحة edit

فنقوم بتعديل أي بيانات لا نرغب بها ونقوم بخزنها مرة أخرى في posts كما في الصورة قمنا بتعديل category ,title أيضا :

Edit Post Germany

Category

Rolex

Tag  
 Germany

Title

Ger

Description

Omega is a luxury Swiss watchmaker headquartered in Biel / Pienne, Switzerland. Omega factories were founded in La Chaux-de-Fonds, Switzerland in the year 1848 by Louis Brandt, who began collecting pocket watches from parts of his factory by local craftsmen.

Choose File No file chosen

Update

بعدها نضغط على update فتظهر كما في الصورة:

No	Title	Edit	Delete
	Ger		

## Laravel- Many To Many Relation Database

نعمل post,tag many to many relation database  
نكتب الامر التالي: `php artisan make:model Tag -m`

```
C:\xampp\htdocs\platformiq>php artisan make:model Tag -m
Model created successfully.
Created Migration: 2020_09_13_233359_create_tags_table
```

قام بانشاء ملف tags في migrations

- 2014\_10\_12\_000000\_create\_users\_table
- 2014\_10\_12\_100000\_create\_password\_rese...
- 2020\_09\_07\_232951\_create\_posts\_table
- 2020\_09\_08\_000313\_create\_categories\_table
- 2020\_09\_13\_233359\_create\_tags\_table

ونكتب فيه الكود التالي:

```
<?php

use Illuminate\Support\Facades\Schema;
use Illuminate\Database\Schema\Blueprint;
use Illuminate\Database\Migrations\Migration;

class CreateTagsTable extends Migration
{

    public function up()
    {
        Schema::create('tags', function (Blueprint $table) {
            $table->increments('id');
            $table->string('tag');
            $table->timestamps();
        });
    }

    public function down()
    {
        Schema::dropIfExists('tags');
    }
}
```

نلاحظ تم إضافة الجدول في قاعدة البيانات:

كما موضح بالصورة:

ونعمل أيضا ملف `post_tag`

فنكتب الامر التالي: `php artisan make:migration post_tag_table_creation`

كما في الصورة:

```
C:\xampp\htdocs\platformiq>php artisan make:migration post_tag_table_creation
Created Migration: 2020_09_14_000011_post_tag_table_creation
```

وأضافه أيضا في ملف `migration`

```
2014_10_12_000000_create_users_table
2014_10_12_100000_create_password_rese...
2020_09_07_232951_create_posts_table
2020_09_08_000313_create_categories_table
2020_09_13_233359_create_tags_table
2020_09_14_000011_post_tag_table_creati...
```

فنذهب اليه ونكتب الكود التالي:

```
<?php

use Illuminate\Support\Facades\Schema;
use Illuminate\Database\Schema\Blueprint;
use Illuminate\Database\Migrations\Migration;

class PostTagTableCreation extends Migration
{
    /**
     * Run the migrations.
     *
     * @return void
     */
    public function up()
    {
        Schema::create('post_tag', function (Blueprint $table) {
            $table->increments('id');
            $table->integer('post_id');
            $table->integer('tag_id');

            $table->timestamps();
        });
    }
}
```

```

    }

    public function down()
    {
        Schema::dropIfExists('post_tag');
    }
}

```

ثم نذهب الى cmd ونكتب الامر التالي:

```
C:\xampp\htdocs\platformiq>php artisan migrate
Migrating: 2020_09_14_000011_post_tag_table_creation
Migrated: 2020_09_14_000011_post_tag_table_creation (0.35 seconds)
```

نلاحظ تم إضافة جدول post\_tag في قاعدة البيانات الخاصة لك كما موضح:

## Laravel-Model-Controller

نعمل model في controller للtag فنكتب الامر التالي:

**php artisan make:controller TagController --resource**

```
C:\xampp\htdocs\platformiq>php artisan make:controller TagController --resource
Controller created successfully.
```

ندخل الى ملف tagcontroller الذي قمنا بانشاءه سابقا ونكتب الكود التالي:

```
<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\Tag;
class TagController extends Controller
{

    public function index()
    {
        return view('tags.index')->with('tags', Tag::all());
    }

    public function create()
    {
        return view('tags.create');
    }

    public function store(Request $request)
    {
        $this->validate($request, [
            'tag' => 'required'
        ]);
        Tag::create([
            'tag' => $request->tag
        ]);

        return redirect()->back();
    }

    public function show($id)
    {
        //
    }
}
```

```

public function edit($id)
{
    $tag = Tag::find($id);
    return view('tags.edit')->with('tag', $tag));
}

public function update(Request $request, $id)
{
    $tag = Tag::find($id);
    $tag = $request->tag;
    $tag->save();
    return redirect()->back();
}

public function destroy($id)
{
    $tag = Tag::find($id);

    $tag->destroy($id);
    return redirect()->back();
}

```

ومن الملف tag في ملف platformiq/app/tag.php ونعمل protected ونكتب الكود التالي:

```

<?php

namespace App;

use Illuminate\Database\Eloquent\Model;

class Tag extends Model
{
    protected $fillable = [
        'tag'
    ];

    public function posts()
    {
        return $this->belongsToMany('App\Post');
    }
}

```

ثم نقوم بعمل ملف Tag في platformiq/resources/views/tag كما فعلنا في category و post

ونعمل داخل هذا الملف صفحة index.php ونكتب الكود التالي:

```
@extends('layouts.app')

@section('content')

Tags

@if ($tags->count()>0)

| No | Title | Edit                                                                                                                                                                                                            |
|----|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    |       | <a class="" href="{{route('tag.edit',['id' =&gt;\$tag-&gt;id ])}}">  </a>                                 |
|    |       | <a class="" href="{{route('tag.delete',['id' =&gt;\$tag-&gt;id ])}}">  </a> |

```

ثم صفحة **create.php** داخل ملف tag ونكتب الكود التالي:

```
@extends('layouts.app')

@section('content')

Create Tag

@if(count($errors)>0)

@foreach ($errors->all() as $error)
- {{$error}}

@endforeach
@endif

ثم نذهب الى ملف app.blade.php لكي نعمل قائمة منسلة للtag ونكتب الكود التالي:

```
<!DOCTYPE html>
<html lang="{{ str_replace('_', '-', app()->getLocale()) }}>
<head>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1">

<meta name="csrf-token" content="{{ csrf_token() }}>

<title>{{ config('app.name', 'Laravel') }}</title>

<script src="{{ asset('js/app.js') }}" defer></script>

<link rel="dns-prefetch" href="//fonts.gstatic.com">
<link href="https://fonts.googleapis.com/css?family=Nunito" rel="stylesheet">

<link href="{{ asset('css/app.css') }}" rel="stylesheet">
</head>
```

 laravel

~ 69 ~

```

```

<body>
<div id="app">
<nav class="navbar navbar-expand-md navbar-light bg-white shadow-sm">
<div class="container">
<a class="navbar-brand" href="{{ url('/') }}>
Rahma altaee
</a>
<ul class="navbar-nav mr-auto">
<li class="nav-item dropdown">
<a class="nav-link dropdown-toggle" href="#" id="navbarDropdown"
role="button" data-toggle="dropdown" aria-haspopup="true" aria-
expanded="false">
Categories
</a>
<div class="dropdown-menu" aria-labelledby="navbarDropdown">
<a class="dropdown-item"
href="{{ route('category.create') }}>Create</a>
<a class="dropdown-item"
href="{{ route('categories') }}>Categories</a>

<div class="dropdown-divider"></div>
<a class="dropdown-item" href="">Edit</a>
</div>
</li>
</ul>

<ul class="navbar-nav mr-auto">
<li class="nav-item dropdown">
<a class="nav-link dropdown-toggle" href="#" id="navbarDropdown"
role="button" data-toggle="dropdown" aria-haspopup="true" aria-
expanded="false">
Tags
</a>
<div class="dropdown-menu" aria-labelledby="navbarDropdown">
<a class="dropdown-item" href="{{ route('tag.create') }}>Create</a>
<a class="dropdown-item" href="{{ route('tags') }}>Tags</a>
<div class="dropdown-divider"></div>
<a class="dropdown-item" href="">Edit</a>
</div>
</li>

</ul>

<ul class="navbar-nav mr-auto">
<li class="nav-item dropdown">
<a class="nav-link dropdown-toggle" href="#" id="navbarDropdown"
role="button" data-toggle="dropdown" aria-haspopup="true" aria-
expanded="false">
Posts
</a>
<div class="dropdown-menu" aria-labelledby="navbarDropdown">
<a class="dropdown-item" href="{{ route('post.create') }}>Create</a>
<a class="dropdown-item" href="{{ route('posts') }}>Posts</a>

<div class="dropdown-divider"></div>
<a class="dropdown-item" href="{{ route('post.trashed') }}>Posts
Softdeleted</a>
</div>

```

## وأخيرا ملف web.php

```
<?php

Route::get('/', function () {
    return view('welcome');
});

Auth::routes();

Route::get('/home', 'HomeController@index')->name('home');

Route::group(['prefix' => 'user', 'middleware'=>'auth'], function ()
{
//Route::group([' middleware'=>'auth'], function () {

    //route for posts
    Route::get('/posts', 'PostsController@index')->name('posts');
    Route::get('/post/trashed', 'PostsController@trashed')-
        >name('post.trashed');
    Route::get('/post/hdelete/{id}', 'PostsController@hdelete')-
        >name('post.hdelete');
    Route::get('/post/restore/{id}', 'PostsController@restore')-
        >name('post.restore');
    Route::get('/post/edit/{id}', 'PostsController@edit')-
        >name('post.edit');
    Route::post('/post/update/{id}', 'PostsController@update')-
        >name('post.update');
    Route::get('/post/create', 'PostsController@create')-
        >name('post.create');
    Route::post('/post/store', 'PostsController@store')-
        >name('post.store');
    Route::get('/post/delete/{id}', 'postsController@destroy')-
        >name('post.delete');

    //route for Categorie
    Route::get('/categories', 'CategoriesController@index')-
        >name('categories');
    Route::get('/category/edit/{id}', 'CategoriesController@edit')-
        >name('category.edit');
    Route::get('/category/delete/{id}', 'CategoriesController@destroy')-
        >name('category.delete');
    Route::get('/category/create', 'CategoriesController@create')-
        >name('category.create');
    Route::post('/category/store', 'CategoriesController@store')-
        >name('category.store');
    Route::post('/category/update/{id}', 'CategoriesController@update')-
        >name('category.update');

    //route for Tag
        Route::get('/tags', 'TagController@index')->name('tags');
        Route::get('/tag/edit/{id}', 'TagController@edit')-
            >name('tag.edit');
            Route::get('/tag/delete/{id}', 'TagController@destroy')-
            >name('tag.delete');
            Route::get('/tag/create', 'TagController@create')-
            >name('tag.create');
            Route::post('/tag/store', 'TagController@store')-
            >name('tag.store');

```

```

        Route::post('/tag/update/{id}', 'TagController@update') ->name('tag.update');

    });

```

كما موضح بالصورة

عند الضغط على `create` من قائمة `tags` نقوم بإدخال معين مثل `TagHeuer` تظهر كما في الصورة:

Create Tag

Name

Save

وتصور قاعدة البيانات:

|   | <b>id</b> | <b>tag</b>          | <b>created_at</b>   | <b>updated_at</b> |
|---|-----------|---------------------|---------------------|-------------------|
| 1 | TagHeuer  | 2020-09-22 22:12:03 | 2020-09-22 22:12:03 |                   |
| 2 | Germany   | 2020-09-22 22:25:38 | 2020-09-22 22:25:38 |                   |

وعند الضغط على `tag` من القائمة المنسدلة تظهر هذه الصفحة:

| Tags     |       |      |
|----------|-------|------|
| No       | Title | Edit |
| TagHeuer |       |      |

عند الضغط على delete تزحف:

## Laravel-post&&tag

ربط post\_tag مع tag و قد عملنا سابقا جدول tag  
ف عند تفريغ صفحة posts, categories, tags  
ونذهب الى categories يحولنا مباشرة الى creatcategories ف ندخل creatpost  
ونذهب الى posts يحولنا الى creatpost مرة أخرى ف نكتب tags معين ثم يحولنا الى creatpost

من خلال كتابة الكود التالي في ملف postscontroller.php في public function create

```
<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\Category;
use App\Post;
use App\Tag;

class postsController extends Controller
{

    public function index()
    {
        return view('posts.index')->with('posts', Post::all());
    }

    public function create()
    {
        $categories = Category::all();
        if ($categories->count() == 0) {
            return redirect()->route('category.create');
        }

        $tags = Tag::all();
        if ($tags->count() == 0) {
```

```

        return redirect()->route('tag.create') ;
    }

    return view('posts.create')->with('categories',$categories)
->with('tags',$tags);

}

```

فبعد الذهاب الى جدول post\_tag نرى انه تم خزن البيانات كما في الصورة:

|  | <input type="checkbox"/> | <input type="checkbox"/> | Edit | <input type="checkbox"/> Copy | <input type="checkbox"/> Delete | <b>id</b> | <b>post_id</b> | <b>tag_id</b> | <b>created_at</b> | <b>updated_at</b> |
|--|--------------------------|--------------------------|------|-------------------------------|---------------------------------|-----------|----------------|---------------|-------------------|-------------------|
|  | <input type="checkbox"/> | <input type="checkbox"/> | Edit | <input type="checkbox"/> Copy | <input type="checkbox"/> Delete | 1         | 4              | 6             | NULL              | NULL              |
|  | <input type="checkbox"/> | <input type="checkbox"/> | Edit | <input type="checkbox"/> Copy | <input type="checkbox"/> Delete | 2         | 5              | 5             | NULL              | NULL              |
|  | <input type="checkbox"/> | <input type="checkbox"/> | Edit | <input type="checkbox"/> Copy | <input type="checkbox"/> Delete | 3         | 5              | 6             | NULL              | NULL              |
|  | <input type="checkbox"/> | <input type="checkbox"/> | Edit | <input type="checkbox"/> Copy | <input type="checkbox"/> Delete | 4         | 5              | 7             | NULL              | NULL              |
|  | <input type="checkbox"/> | <input type="checkbox"/> | Edit | <input type="checkbox"/> Copy | <input type="checkbox"/> Delete | 5         | 5              | 8             | NULL              | NULL              |
|  | <input type="checkbox"/> | <input type="checkbox"/> | Edit | <input type="checkbox"/> Copy | <input type="checkbox"/> Delete | 6         | 3              | 6             | NULL              | NULL              |
|  | <input type="checkbox"/> | <input type="checkbox"/> | Edit | <input type="checkbox"/> Copy | <input type="checkbox"/> Delete | 7         | 4              | 5             | NULL              | NULL              |
|  | <input type="checkbox"/> | <input type="checkbox"/> | Edit | <input type="checkbox"/> Copy | <input type="checkbox"/> Delete | 8         | 4              | 7             | NULL              | NULL              |

\* عند الضغط على edit من صفحة posts ترجعنا الى صفحة create مع البيانات جميعها وأيضا التي اختارها المستخدم في البداية قبل التعديل

فنذهب الى ملف **post/edit.blade.php**

```

@extends('layouts.app')

@section('content')

Edit Post {{ $posts->title }}

@if(count($errors)>0)

@foreach ($errors->all() as $error)
- {{$error}}

@endforeach
@endif

@endif

```

```

<form action="{{ route('post.update', ['id' => $posts->id ]) }}" method="POST" enctype="multipart/form-data">
{{ csrf_field() }}
<div class="form-group">
<label for="category_id">Category</label>
<select class="form-control" name="category_id" id="category">

@foreach ($categories as $category)
@if ($category->id == $posts->category_id)
<option value="{{ $category->id }}" selected>{{$category->name}}</option>
@else
<option value="{{ $category->id }}" >{{$category->name}}</option>
@endif

@endforeach

</select>
</div>

<div class="form-check">
@foreach ($tags as $tag)
<label class="form-check-label" >
<input class="form-check-input" type="checkbox" name="tags[]" value="{{ $tag->id }}"

@foreach ($posts->tags as $ta)
@if ($tag->id == $ta->id)
checked
@endif
@endforeach
> {{ $tag->tag }} </label><br>
@endforeach

```

```

</div>

<div class="form-group">
<label for="title">Title</label>
<input type="text" class="form-control" name="title" value="{{ $posts->title }}>
</div>
<div class="form-group">
<label for="content">Description</label>
<textarea class="form-control" name="content" id="content" rows="8" cols="8">
{{ $posts->content }}
</textarea>
</div>
<div class="form-group">
<label for="featured">Photo</label>
<input type="file" class="form-control-file" name="featured">
</div>
<button type="submit" class="btn btn-primary">Update</button>
</form>

</div>
</div>
</div>

```

```
</div>
</div>
@endsection
```

ثم ملف update في postcontroller

```
<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\Category;
use App\Post;
use App\Tag;

class postsController extends Controller
{
    public function update(Request $request, $id)
    {

        $post = Post::find($id);

        $this->validate($request, [
            "title"      => "required",
            "content"    => "required",
            "category_id"  => "required"
        ]);

        if ( $request->hasFile('featured') ) {
            $featured = $request->featured;
            $featured_new_name = time().$featured->getClientOriginalName();
            $featured->move('uploads/posts/', $featured_new_name);

            $post->featrueed = 'uploads/posts/' . $featured_new_name;
        }
        //dd($post);
        $post->title = $request->title;
        $post->content = $request->content;
        $post->category_id = $request->category_id;
        $post->save();

        $post->tags() -> sync($request->tags);

        return redirect()->route('posts');
    }
}
```

## Laravel-One To One

طريقة `profiles` نعمل جدول جديد باسم one-to-one  
نذهب الى ملف: `migration/2014_10_12_000000_create_users_table`  
ونضيف الكود التالي:

```
<?php

use Illuminate\Support\Facades\Schema;
use Illuminate\Database\Schema\Blueprint;
use Illuminate\Database\Migrations\Migration;

class CreateUsersTable extends Migration
{

    public function up()
    {
        Schema::create('users', function (Blueprint $table) {
            $table->bigIncrements('id');
            $table->string('name');
            $table->string('email')->unique();
            $table->boolean('admin')->default(0);
            $table->timestamp('email_verified_at')->nullable();
            $table->string('password');
            $table->rememberToken();
            $table->timestamps();
        });
    }

    public function down()
    {
        Schema::dropIfExists('users');
    }
}
```

ونكتب الامر التالي لعمل جدول `:profile`

```
C:\xampp\htdocs\platformiq>php artisan make:model profile -m
Model created successfully.
Created Migration: 2020_09_15_225127_create_profiles_table
```

## Laravel-Navbar-Profile

فندخل الى هذا الملف profile.php ونكتب الكود التالي:

```
<?php

use Illuminate\Support\Facades\Schema;
use Illuminate\Database\Schema\Blueprint;
use Illuminate\Database\Migrations\Migration;

class CreateProfilesTable extends Migration
{
    public function up()
    {
        Schema::create('profiles', function (Blueprint $table) {
            $table->increments('id');
            $table->string('avatar')->nullable();
            $table->integer('user_id');
            $table->string('facebook')->nullable();
            $table->string('twitter')->nullable();
            $table->string('github')->nullable();
            $table->string('about')->nullable();

            $table->timestamps();
        });
    }

    public function down()
    {
        Schema::dropIfExists('profiles');
    }
}
```

ثم نذهب الى app/user.php

ونكتب الكود التالي:

```
<?php

namespace App;

use Illuminate\Notifications\Notifiable;
use Illuminate\Contracts\Auth\MustVerifyEmail;
use Illuminate\Foundation\Auth\User as Authenticatable;

class User extends Authenticatable
{
    use Notifiable;

    protected $fillable = [
        'name', 'email', 'password', 'admin',
    ];
}
```

```

protected $hidden = [
    'password', 'remember_token',
];

public function profile() {
    return $this->hasOne('App\Profile');
}

```

ثم نكتب الامر التالي في cmd لعمل migration  
**php artisan migrate**

```
C:\xampp\htdocs\platformiq>php artisan migrate
Migrating: 2020_09_15_225127_create_profiles_table
Migrated: 2020_09_15_225127_create_profiles_table (0.6 seconds)
```

**ملاحظة:** عند إضافة حقل جديد إلى الصفحة دائمًا نكتب الامر التالي لكي يقوم بإلغاء جميع البيانات ويصفرها

**php artisan migrate:refresh**

تم إضافة الجدول مع الحقول التي قمنا بادخالها في قاعدة البيانات

ويصفرها

نذهب إلى ملف app/profile ونكتب الكود التالي:

```

<?php

namespace App;

use Illuminate\Database\Eloquent\Model;

class profile extends Model
{
    public function user() {
        return $this->belongsTo('App\User');
    }
}
```

```
protected $fillable = [
    'avatar', 'user_id', 'facebook', 'twitter', 'github', 'about'
];
```

ثم ندخل الى ملف `app/views/layouts/app.blade.php`  
ونكتب الكود التالي لاضافة `profile` الى `navbar`

```
<!DOCTYPE html>
<html lang="{{ str_replace('_', '-', app()>getLocale()) }}>
<head>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1">

<!-- CSRF Token -->
<meta name="csrf-token" content="{{ csrf_token() }}>

<title>{{ config('app.name', 'Laravel') }}</title>
@yield('styles')
<!-- Scripts -->
<script src="{{ asset('js/app.js') }}" defer></script>

<!-- Fonts -->
<link rel="dns-prefetch" href="//fonts.gstatic.com">
<link href="https://fonts.googleapis.com/css?family=Nunito"
rel="stylesheet" type="text/css">

</li>
@endif
@else
<li class="nav-item dropdown">
<a id="navbarDropdown" class="nav-link dropdown-toggle" href="#" role="button" data-toggle="dropdown" aria-haspopup="true" aria-expanded="false" v-pre>
{{ Auth::user() -> name }} <span class="caret"></span>
</a>
<div class="dropdown-menu dropdown-menu-right" aria-labelledby="navbarDropdown">
<a class="dropdown-item" href="{{ route('users.profile') }}">&Profile&{{ __('Logout') }}

```

فقط يظهر كما في الصورة:

## صفحة Web.php

```
<?php

Auth::routes();

Auth::routes(['verify' => true]);
Route::get('/home', 'HomeController@index')->name('home');

//Route::group(['prefix' => 'user', 'middleware'=>'auth'], function()
() {
Route::group(['middleware'=>'auth'], function () {

//route for posts
Route::get('/posts', 'PostsController@index')->name('posts');
Route::get('/post/trashed', 'PostsController@trashed')-
>name('post.trashed');
Route::get('/post/hdelete/{id}', 'PostsController@hdelete')-
>name('post.hdelete');
Route::get('/post/restore/{id}', 'PostsController@restore')-
>name('post.restore');
Route::get('/post/edit/{id}', 'PostsController@edit')-
>name('post.edit');
Route::post('/post/update/{id}', 'PostsController@update')-
>name('post.update');
Route::get('/post/create', 'PostsController@create')-
>name('post.create');
Route::post('/post/store', 'PostsController@store')-
>name('post.store');
Route::get('/post/delete/{id}', 'postsController@destroy')-
>name('post.delete');

//route for Categorie
Route::get('/categories', 'CategoriesController@index')-
>name('categories');
Route::get('/category/edit/{id}', 'CategoriesController@edit')-
>name('category.edit');
Route::get('/category/delete/{id}', 'CategoriesController@destroy')-
>name('category.delete');
Route::get('/category/create', 'CategoriesController@create')-
>name('category.create');
Route::post('/category/store', 'CategoriesController@store')-
>name('category.store');
Route::post('/category/update/{id}', 'CategoriesController@update')-
>name('category.update');

//route for Tag
    Route::get('/tags', 'TagController@index')->name('tags');
    Route::get('/tag/edit/{id}', 'TagController@edit')-
>name('tag.edit');
        Route::get('/tag/delete/{id}', 'TagController@destroy')-
>name('tag.delete');

```

```

        Route::get('/tag/create', 'TagController@create')-
>name('tag.create');
        Route::post('/tag/store', 'TagController@store')-
>name('tag.store');
        Route::post('/tag/update/{id}', 'TagController@update')-
>name('tag.update');

//route for users
Route::get('/users', 'UsersController@index')->name('users');
Route::get('/users/admin/{id}', 'UsersController@admin')-
>name('users.admin'); //->middleware('admin');
Route::get('/users/notadmin/{id}', 'UsersController@notAdmin')-
>name('users.not.admin');
Route::get('/users/create', 'UsersController@create')-
>name('users.create');
Route::post('/users/store', 'UsersController@store')-
>name('users.store');
Route::get('/users/delete/{id}', 'UsersController@destroy')-
>name('users.delete');

//route for user profile
Route::get('/users/profile', 'ProfilesController@index')-
>name('users.profile');
Route::post('/users/profile/update', 'ProfilesController@update')-
>name('users.profile.update');
    Route::get('/users/profile/create', 'ProfilesController@create')-
>name('users.profile.create');

```

فبعد الضغط على **profile** تظهر لنا كما في الصورة:

About

**Update**

## Laravel-Navbar-Users

الآن نعمل صفحة في navbar الى جانب قائمة categories نعمل tag users فنذهب الى ملف app.blade.php

```
<!DOCTYPE html>
<html lang="{{ str_replace('_', '-', app()>getLocale()) }}>
<head>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1">

<!-- CSRF Token -->
<meta name="csrf-token" content="{{ csrf_token() }}>

<title>{{ config('app.name', 'Laravel') }}</title>

<!-- Scripts -->
<script src="{{ asset('js/app.js') }}" defer></script>

<!-- Fonts -->
<link rel="dns-prefetch" href="//fonts.gstatic.com">
<link href="https://fonts.googleapis.com/css?family=Nunito" rel="stylesheet">

<!-- Styles -->
<link href="{{ asset('css/app.css') }}" rel="stylesheet">
</head>
<body>
<div id="app">
<nav class="navbar navbar-expand-md navbar-light bg-white shadow-sm">
<div class="container">
<a class="navbar-brand" href="{{ url('/') }}>
Rahma altaee
</a>

<ul class="navbar-nav mr-auto">
<li class="nav-item dropdown">
<a class="nav-link dropdown-toggle" href="#" id="navbarDropdown" role="button" data-toggle="dropdown" aria-haspopup="true" aria-expanded="false">
Users
</a>
<div class="dropdown-menu" aria-labelledby="navbarDropdown">

<a class="dropdown-item" href="{{ route('users') }}>Users</a>
<a class="dropdown-item" href="{{ route('users.create') }}>Create user</a>
<div class="dropdown-divider"></div>
<a class="dropdown-item" href="">Edit</a>
</div>
</li>
</ul>
<ul class="navbar-nav mr-auto">
<li class="nav-item dropdown">
<a class="nav-link dropdown-toggle" href="#" id="navbarDropdown" role="button" data-toggle="dropdown" aria-haspopup="true" aria-expanded="false">
```

```

Categories
</a>
<div class="dropdown-menu" aria-labelledby="navbarDropdown">
<a class="dropdown-item"
  href="{{ route('category.create') }}">Create</a>
<a class="dropdown-item"
  href="{{ route('categories') }}>Categories</a>
<div class="dropdown-divider"></div>
<a class="dropdown-item" href="">Edit</a>
</div>
</li>
</ul>
<ul class="navbar-nav mr-auto">
<li class="nav-item dropdown">
<a class="nav-link dropdown-toggle" href="#" id="navbarDropdown"
  role="button" data-toggle="dropdown" aria-haspopup="true" aria-
  expanded="false">
Tags
</a>
<div class="dropdown-menu" aria-labelledby="navbarDropdown">
<a class="dropdown-item" href="{{ route('tag.create') }}">Create</a>
<a class="dropdown-item" href="{{ route('tags') }}>Tags</a>
<div class="dropdown-divider"></div>
<a class="dropdown-item" href="">Edit</a>
</div>
</li>
</ul>
<ul class="navbar-nav mr-auto">
<li class="nav-item dropdown">
<a class="nav-link dropdown-toggle" href="#" id="navbarDropdown"
  role="button" data-toggle="dropdown" aria-haspopup="true" aria-
  expanded="false">
Posts
</a>
<div class="dropdown-menu" aria-labelledby="navbarDropdown">
<a class="dropdown-item" href="{{ route('post.create') }}">Create</a>
<a class="dropdown-item" href="{{ route('posts') }}>Posts</a>
<div class="dropdown-divider"></div>
<a class="dropdown-item" href="{{ route('post.trashed') }}>Posts
Softdeleted</a>
</div>
</li>
</ul>
<button class="navbar-toggler" type="button" data-toggle="collapse"
  data-target="#navbarSupportedContent" aria-
  controls="navbarSupportedContent" aria-expanded="false" aria-
  label="{{ __('Toggle navigation') }}>
<span class="navbar-toggler-icon"></span>
</button>
<div class="collapse navbar-collapse" id="navbarSupportedContent">
<!-- Left Side Of Navbar --&gt;
&lt;ul class="navbar-nav mr-auto"&gt;
&lt;/ul&gt;
<!-- Right Side Of Navbar --&gt;
&lt;ul class="navbar-nav ml-auto"&gt;
<!-- Authentication Links --&gt;
<b>@guest
<li class="nav-item">
<a class="nav-link" href="{{ route('login') }}>{{ __('Login') }}</a>
</li>
@if (Route::has('register'))

```

```

<li class="nav-item">
<a class="nav-link" href="{{ route('register') }}">{{ __('Register') }}</a>
</li>
@endif
@else
<li class="nav-item dropdown">
<a id="navbarDropdown" class="nav-link dropdown-toggle" href="#" role="button" data-toggle="dropdown" aria-haspopup="true" aria-expanded="false" v-pre>
{{ Auth::user() ->name }} <span class="caret"></span>
</a>
<div class="dropdown-menu dropdown-menu-right" aria-labelledby="navbarDropdown">
<a class="dropdown-item" href="{{ route('users.profile') }}>Profile</a>
<a class="dropdown-item" href="{{ route('logout') }}" onclick="event.preventDefault();
document.getElementById('logout-form').submit();">
{{ __('Logout') }}</a>
<form id="logout-form" action="{{ route('logout') }}" method="POST" style="display: none;">
@csrf
</form>
</div>
</li>
@endguest
</ul>
</div>
</div>
</nav>
<main class="py-4">
@yield('content')
</main>
</div>
@yield('scripts')
</body>
</html>

```

ثم نعمل controller لملف user وكتابة الامر التالي:

**php artisan make:controller usersController --resource**

```
C:\xampp\htdocs\platformiq>php artisan make:controller usersController --resource
Controller created successfully.
```

ندخل الى **userscontroller** الذي قمنا بانشاءه ونكتب الكود التالي:

```
<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\User;
use App\profile;

class usersController extends Controller
{

    public function index()
    {
        return view('users.index')->with('users',User::all());
    }

    public function create()
    {

        return view('users.create');
    }
    public function store(Request $request)
    {
        $this->validate($request,[
            'name' => 'required',
            'email' => 'required',
        ]);

        $user = User::create([
            'name' => $request->name,
            'email' => $request->email,
            'password' => bcrypt('password')
        ]);

        $profile = Profile::create([
            'user_id' => $user->id,
            'avatar' => 'uploads/avatar/1.png'
        ]);

        return redirect()->route('users');
    }

    public function show($id)
    {
        //
    }

    public function edit($id)
    {
        //
    }

    public function update(Request $request, $id)
    {
        //
    }
}
```

```

public function destroy($id)
{
    $user = User::find($id);
    $user->profile->delete($id);
    $user->delete();
    return redirect()->route('users');

}

public function admin($id)
{
    $user = User::find($id);
    $user->admin = 1;
    $user->save();
    return redirect()->route('users');
}
public function notAdmin($id)
{
    $user = User::find($id);
    $user->admin = 0;
    $user->save();
    return redirect()->route('users');
}

```

## ثم ملف users,profiles web.php لاضافة

```

<?php

Route::get('/', function () {
    return view('welcome');
});

Auth::routes();

Route::get('/home', 'HomeController@index')->name('home');

Route::group(['prefix' => 'user', 'middleware'=>'auth'], function ()
{

//route for posts
Route::get('/posts', 'PostsController@index')->name('posts');
Route::get('/post/trashed', 'PostsController@trashed')-
>name('post.trashed');
Route::get('/post/hdelete/{id}', 'PostsController@hdelete')-
>name('post.hdelete');
Route::get('/post/restore/{id}', 'PostsController@restore')-
>name('post.restore');
Route::get('/post/edit/{id}', 'PostsController@edit')-
>name('post.edit');
Route::post('/post/update/{id}', 'PostsController@update')-
>name('post.update');

```

```

Route::get('/post/create', 'PostsController@create')-
>name('post.create');
Route::post('/post/store', 'PostsController@store')-
>name('post.store');
Route::get('/post/delete/{id}', 'postsController@destroy')-
>name('post.delete');

//route for Categorie
Route::get('/categories', 'CategoriesController@index')-
>name('categories');
Route::get('/category/edit/{id}', 'CategoriesController@edit')-
>name('category.edit');
Route::get('/category/delete/{id}', 'CategoriesController@destroy')-
>name('category.delete');
Route::get('/category/create', 'CategoriesController@create')-
>name('category.create');
Route::post('/category/store', 'CategoriesController@store')-
>name('category.store');
Route::post('/category/update/{id}', 'CategoriesController@update')-
>name('category.update');

//route for Tag
Route::get('/tags', 'TagController@index')->name('tags');
Route::get('/tag/edit/{id}', 'TagController@edit')->name('tag.edit');
Route::get('/tag/delete/{id}', 'TagController@destroy')-
>name('tag.delete');
Route::get('/tag/create', 'TagController@create')-
>name('tag.create');
Route::post('/tag/store', 'TagController@store')->name('tag.store');
Route::post('/tag/update/{id}', 'TagController@update')-
>name('tag.update');

//route for users
Route::get('/users', 'UsersController@index')->name('users');
Route::get('/users/admin/{id}', 'UsersController@admin')-
>name('users.admin'); //->middleware('admin');
Route::get('/users/notadmin/{id}', 'UsersController@notAdmin')-
>name('users.not.admin');
Route::get('/users/create', 'UsersController@create')-
>name('users.create');
Route::post('/users/store', 'UsersController@store')-
>name('users.store');
Route::post('/users/delete{id}', 'UsersController@destroy')-
>name('users.delete');

//route for user profile
Route::get('/users/profile', 'ProfilesController@index')-
>name('users.profile');
Route::post('/users/profile/update', 'ProfilesController@update')-
>name('users.profile.update');

}) ;

```

ثم نعمل ملف اسماه users داخل ملف platformiq/resources/views/users  
ونضع فيه ملف creat.blade.php

```
@extends('layouts.app')

@section('content')
<div class="container">
<div class="row justify-content-center">
<div class="col-md-8">
<div class="card">
<div class="card-header">Create User</div>

<div class="card-body">
@if(count($errors)>0)
<ul class="navbar-nav mr-auto">
@foreach ($errors->all() as $error)
<li class="nav-item active">
{{$error}}
</li>
@endforeach
</ul>
@endif
<form action="{{route('users.store')}}" method="POST" >
{{ csrf_field() }}
<div class="form-group">
<label for="name">Name</label>
<input type="text" class="form-control" name="name"
placeholder="Enter user name">
</div>

<div class="form-group">
<label for="email">Email</label>
<input type="text" class="form-control" name="email"
placeholder="Enter user email">
</div>

<button type="submit" class="btn btn-primary">Save</button>
</form>
</div>
</div>
</div>
</div>
</div>
@endsection
```

ثم نعمل ملف اخر باسم index.php ونضعه في ملف users

```
@extends('layouts.app')

@section('content')
<div class="container">
<div class="row justify-content-center">
<div class="col-md-8">
<div class="card">
<div class="card-header">Users</div>
```

```

<div class="card-body">

@if ($users->count()>0)

| No                                                                                                                          | Title              | Edit                                                                                                                                                                                                                                                               | Delete                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
|  | {{ \$user->name }} | @if (\$user->admin) <a class="" href="{{ route('users.not.admin', ['id' =&gt; \$user-&gt;id]) }}">     delete admin   </a> @else <a class="" href="{{ route('users.admin', ['id' =&gt; \$user-&gt;id]) }}">     make admin   </a> @endif <a class="" href=""> </a> | <a class="" href="#"></a> |

```

ثم نعمل ملف اخر الى جانب ملف posts ويكون باسم avatar داخل ملف platformiq/public لكي نخزن فيه صورة المستخدم:

ثم ملف profilescontroller.php

```
<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use Auth;
use App\Profile;
class ProfilesController extends Controller
{

    public function index()
    {

        $user = Auth::user();
        $id = Auth::id();

        if ($user->profile == null) {

            $profile = Profile::create([
                'user_id' => $id,
                'avatar' => 'uploads/avatar/1.png'
            ]);

        }

        return view('users.profile')->with('user',Auth::user());
    }

    public function create()
    {
        //
    }

    public function store(Request $request)
    {
        //
    }

    public function show($id)
    {
        //
    }

    public function edit($id)
    {
        //
    }

    public function update(Request $request )
    {
```

```

    {

$this->validate($request, [
    "name"      => "required",
    "email"     => "required|email"

]) ;

$user = Auth::user();

if ( $request->hasFile('avatar') ) {
    $avatar = $request->avatar;
    $avatar_new_name = time() . $avatar-
>getClientOriginalName();
    $avatar->move('uploads/avatar/' , $avatar_new_name);
    $user->profile->avatar =
'uploads/avatar/'. $avatar_new_name;
    $user->profile->save();

}

$user->name = $request->name;
$user->email = $request->email;
$user->profile->facebook = $request->facebook;
$user->profile->twitter = $request->twitter;
$user->profile->github = $request->github;
$user->profile->about = $request->about;
$user->save();
$user->profile->save();

if ( $request->has('password') ) {

    $user->password = bcrypt($request->password);
    $user->save();
}
return redirect()->back();

}

public function destroy($id)
{
    //
}

```

Users ▾ Settings ▾

فقط نظر لنا كما في الصورة

عند الضغط على **users** من القائمة المنسدلة تظهر كما في الصورة:

| No  | Title       | Edit                       | Delete  |
|---|-------------|----------------------------|---|
|  | RahmaAltaee | <a href="#">make admin</a> |  |
|  | Omer        | <a href="#">make admin</a> |  |

عند الضغط على **make admin** يصبح هنا الشخص ادمي كما في الصورة:

| No  | Title       | Edit                         | Delete  |
|---|-------------|------------------------------|---|
|  | RahmaAltaee | <a href="#">delete admin</a> |  |

و عند الضغط على **create user** من القائمة المنسدلة لكي نقوم بعمل **user** جديد كما في الصورة:

Create User

Name

Email

**Save**

نعمل جدول في قاعدة البيانات من خلال الامر `php artisan users-m`

فندخل الى ملف `create users table` ونكتب فيه الكود التالي:

```
<?php

use Illuminate\Support\Facades\Schema;
use Illuminate\Database\Schema\Blueprint;
use Illuminate\Database\Migrations\Migration;

class UserIdPosts extends Migration
{

    public function up()
    {
        Schema::table('posts', function (Blueprint $table) {
            $table->integer('user_id');
        });
    }

    public function down()
    {
        Schema::table('posts', function (Blueprint $table) {
            $table->dropColumn('user_id');
        });
    }
}
```

نعمل جدول في قاعدة البيانات من خلال الامر: `php artisan migrate:refresh`

نلاحظ انه قام بعمل جدول في قاعدة البيانات باسم `user` كما في الصورة:

وقام بإدخال البيانات والرقم 1 في حقل `admin` يعني انه قام بعمل هذا الشخص `user` كما في الصورة:

|   | <code>id</code> | <code>name</code> | <code>email</code>   | <code>admin</code> | <code>email_verified_at</code> | <code>password</code>                                    | <code>remember_token</code> |
|---|-----------------|-------------------|----------------------|--------------------|--------------------------------|--|-----------------------------|
| e | 1               | RahmaAltaee       | RahmaLabib@gmail.com | 1                  | NULL                           | \$2y\$10\$TgIK873vw9v3gpk2A2WDf.fOzcC139s.U4lapllgIE6... | NULL                        |
| e | 2               | Omer              | omer@gmail.com       | 0                  | NULL                           | \$2y\$10\$p/7aKEnt3UKu8n7Y12Znx.rWK4kWRQLHKum/X1MvVAV... | NULL                        |

## Laravel-Navbar-Settings

عمل جدول وقائمة منسلقة setting

php artisan make:model settings -m

```
C:\xampp\htdocs\platformiq>php artisan make:model settings -m
Model created successfully.
Created Migration: 2020_09_18_004737_create_settings_table
```

نذهب الى ملف create settings table ونكتب فيه الكود التالي:

```
<?php

use Illuminate\Support\Facades\Schema;
use Illuminate\Database\Schema\Blueprint;
use Illuminate\Database\Migrations\Migration;

class CreateSettingsTable extends Migration
{

    public function up()
    {
        Schema::create('settings', function (Blueprint $table) {
            $table->increments('id');
            $table->string('blog_name') ;
            $table->string('phone_number') ;
            $table->string('blog_email') ;
            $table->string('address') ;

            $table->timestamps();
        });
    }

    public function down()
    {
        Schema::dropIfExists('settings');
    }
}
```

ملف platformiq/app/ setings.php

ونكتب الكود التالي:

```
<?php

namespace App;

use Illuminate\Database\Eloquent\Model;
```

```

class Setting extends Model
{
    protected $fillable = ['blog_name', 'phone_number', 'blog_email'
, 'address'];
}

```

ثم نعمل ملف باسم settings في ملف platformiq/resources/views /settings

ونعمل بداخله ملف settings.blade.php

ونكتب فيه الكود التالي:

```

@extends('layouts.app')

@section('content')

Edit Settings

@if(count($errors)>0)

@foreach ($errors->all() as $error)
- {{$error}}

@endforeach
@endif

@endif
<form action="{{ route('settings.update') }}" method="POST" >
{{ csrf_field() }}

<label for="blog_name">Blog name</label>
<input type="text" class="form-control" name="blog_name"
value="{{$settings->blog_name}}>

<label for="phone_number">Phone </label>
<input type="text" class="form-control" name="phone_number"
value="{{$settings->phone_number}}>

<label for="blog_email">Email</label>
<input type="text" class="form-control" name="blog_email"
value="{{$settings->blog_email}}>

<label for="address">Address</label>
<input type="text" class="form-control" name="address"
value="{{$settings->address}}>

<button type="submit" class="btn btn-primary">Update</button>
</form>

```

```
</div>
</div>
</div>
</div>
@endsection
```

لملئ البيانات في الجداول اوتوماتيكيا نستخدم الامر **seeder**

فنعمل الامر:

```
php artisan make:seeder SettingsSeeder
platformiq/database/seeds/ SettingsSeeder
```

ونكتب فيه الكود التالي:

```
<?php

use Illuminate\Database\Seeder;

class SettingsSeeder extends Seeder
{

    public function run()
    {

        \App\Setting::create([
            'blog_name'=> 'Hours Project' ,
            'phone_number'=> '00 964 123 1234' ,
            'blog_email'=> 'rahma.taee@codeforiraq.org' ,
            'address'=> 'IRAQ - mosul'
        ]);
    }
}
```

ثم بعد ذلك نعمل **controller** كما فعلنا في السابق

فنقوم بكتابة المر التالي: **php artisan make:controller SettingsController**

```
C:\xampp\htdocs\platformiq>php artisan make:controller SettingsController
Controller created successfully.
```

ونكتب بداخله الكود التالي:

```
<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\Setting;
class SettingsController extends Controller
{

    public function index() {
        return view('settings.settings')->with('settings',
Setting::first());
    }

    public function update(Request $request) {

        $this->validate($request, [
            "blog_name"      => "required",
            "phone_number"   => "required",
            "blog_email"     => "required" ,
            "address"        => "required"
        ]);

        $setting = Setting::first();

        $setting->blog_name = $request->blog_name;
        $setting->phone_number = $request->phone_number;
        $setting->blog_email = $request->blog_email;
        $setting->address = $request->address;
        $setting->save();

        return redirect()->back();
    }
}
```

ثم بعد ذلك نذهب الى ملف web.php لاضافة

فنكتب الكود التالي:

```
<?php

Auth::routes();

Auth::routes(['verify' => true]);
Route::get('/home', 'HomeController@index')->name('home');
```

```

//Route::group(['prefix' => 'user', 'middleware'=>'auth'], function
() {
Route::group([ 'middleware'=>'auth'], function () {

    //route for posts
Route::get('/posts', 'PostsController@index')->name('posts');
Route::get('/post/trashed', 'PostsController@trashed')-
>name('post.trashed');
Route::get('/post/hdelete/{id}', 'PostsController@hdelete')-
>name('post.hdelete');
Route::get('/post/restore/{id}', 'PostsController@restore')-
>name('post.restore');
Route::get('/post/edit/{id}', 'PostsController@edit')-
>name('post.edit');
Route::post('/post/update/{id}', 'PostsController@update')-
>name('post.update');
Route::get('/post/create', 'PostsController@create')-
>name('post.create');
Route::post('/post/store', 'PostsController@store')-
>name('post.store');
Route::get('/post/delete/{id}', 'postsController@destroy')-
>name('post.delete');

    //route for Categorie
Route::get('/categories', 'CategoriesController@index')-
>name('categories');
Route::get('/category/edit/{id}', 'CategoriesController@edit')-
>name('category.edit');
Route::get('/category/delete/{id}', 'CategoriesController@destroy')-
>name('category.delete');
Route::get('/category/create', 'CategoriesController@create')-
>name('category.create');
Route::post('/category/store', 'CategoriesController@store')-
>name('category.store');
Route::post('/category/update/{id}', 'CategoriesController@update')-
>name('category.update');

    //route for Tag
        Route::get('/tags', 'TagController@index')->name('tags');
        Route::get('/tag/edit/{id}', 'TagController@edit')-
>name('tag.edit');
        Route::get('/tag/delete/{id}', 'TagController@destroy')-
>name('tag.delete');
        Route::get('/tag/create', 'TagController@create')-
>name('tag.create');
        Route::post('/tag/store', 'TagController@store')-
>name('tag.store');
        Route::post('/tag/update/{id}', 'TagController@update')-
>name('tag.update');

    //route for users
Route::get('/users', 'UsersController@index')->name('users');
Route::get('/users/admin/{id}', 'UsersController@admin')-
>name('users.admin'); //->middleware('admin');
Route::get('/users/notadmin/{id}', 'UsersController@notAdmin')-
>name('users.not.admin');
Route::get('/users/create', 'UsersController@create')-
>name('users.create');
Route::post('/users/store', 'UsersController@store')-
>name('users.store');

```

```

Route::get('/users/delete/{id}', 'UsersController@destroy')->name('users.delete');

//route for user profile
Route::get('/users/profile', 'ProfilesController@index')->name('users.profile');
Route::post('/users/profile/update', 'ProfilesController@update')->name('users.profile.update');
Route::get('/users/profile/create', 'ProfilesController@create')->name('users.profile.create');

//route for Settings
Route::get('/settings', 'SettingsController@index')->name('settings');
Route::post('/settings/update', 'SettingsController@update')->name('settings.update');

//route for User front end
    Route::get('/', 'siteUIcontroller@index')->name('index');
    Route::get('/category/{id}', 'siteUIcontroller@category')->name('category.show');
        Route::get('/tag/{id}', 'siteUIcontroller@tag')->name('tag.show');
}) ;

```

فقط يظهر كما في الصورة:

و عند الضغط على كلمة show من القائمة تظهر كما في الصورة:

Edit Settings

Blog name

Phone

Email

Address

**Update**

و أيضا تستطيع تغيير أي حقل وتقوم بعمل update فيقوم بالتحديث الجديد ..

والآن قام بعمل جدول settings في قاعدة البيانات وقام بملئ البيانات داخلها:

| <b>id</b> | <b>blog_name</b> | <b>phone_number</b> | <b>blog_email</b> | <b>address</b> | <b>created_at</b> | <b>updated_at</b>   |
|-----------|------------------|---------------------|-------------------|----------------|-------------------|---------------------|
| 1         | Hours Project    | 092655443           | rahma@email.com   | Iraq_Mosul     | NULL              | 2020-09-25 20:01:49 |

# Laravel-Dashboard

واخير بعد عمل كل القوائم والصفحات في `Dashboard` نقوم بعمل `navbar` لحساب عدد البيانات الموجودة في كل جدول `dashboard.blade.php` فنعمل صفحة `dashboard.blade.php` ونكتب الكود التالي:

```
@extends('layouts.app')

@section('content')
<div class="container">
<div class="row justify-content-center">
<div class="col-md-10">
<div class="card">
<div class="card-header">Dashboard</div>

<div class="card-body">
@if (session('status'))
<div class="alert alert-success" role="alert">
{{ session('status') }}
</div>
@endif
@endif

<div class="container">
<div class="row">
<div class="col-sm">
<div class="card text-white bg-primary mb-3" style="max-width: 18rem;">
<div class="card-header">Posts</div>
<div class="card-body">
<h5 class="card-title">{{$post_count}}</h5>
</div>
</div>
</div>
<div class="col-sm">
<div class="card text-white bg-secondary mb-3" style="max-width: 18rem;">
<div class="card-header">Users</div>
<div class="card-body">
<h5 class="card-title">{{$users_count}}</h5>
</div>
</div>
</div>
<div class="col-sm">
<div class="card text-white bg-success mb-3" style="max-width: 18rem;">
<div class="card-header">Categories</div>
<div class="card-body">
<h5 class="card-title">{{$categories_count}}</h5>
</div>
</div>
```

```

</div>
</div>
</div>

<div class="container">
<div class="row">
<div class="col-sm">
<div class="card text-white bg-dark mb-3" style="max-width: 18rem;">
<div class="card-header">Tags</div>
<div class="card-body">
<h5 class="card-title">{{$tags_count}}</h5>
</div>
</div>

</div>
<div class="col-sm">
<div class="card bg-light mb-3" style="max-width: 18rem;">
<div class="card-header">Trashed Posts</div>
<div class="card-body">
<h5 class="card-title">{{$trashed_count}}</h5>
</div>
</div>
</div>

<div class="col-sm">
<div class="card text-white bg-info mb-3" style="max-width: 18rem;">
<div class="card-header">Header</div>
<div class="card-body">
<h5 class="card-title">Info card title</h5>
</div>
@endsection

```

ثم ملف web.php ونكتب فيه الكود التالي:

```
<?php
```

```
Auth::routes();
```

```
Auth::routes(['verify' => true]);
Route::get('/home', 'HomeController@index')->name('home');
```

```

//Route::group(['prefix' => 'user', 'middleware'=>'auth'], function
() {
Route::group([ 'middleware'=>'auth'], function () {

    //route for posts
Route::get('/posts', 'PostsController@index')->name('posts');
Route::get('/post/trashed', 'PostsController@trashed')-
>name('post.trashed');
Route::get('/post/hdelete/{id}', 'PostsController@hdelete')-
>name('post.hdelete');
Route::get('/post/restore/{id}', 'PostsController@restore')-
>name('post.restore');
Route::get('/post/edit/{id}', 'PostsController@edit')-
>name('post.edit');
Route::post('/post/update/{id}', 'PostsController@update')-
>name('post.update');
Route::get('/post/create', 'PostsController@create')-
>name('post.create');
Route::post('/post/store', 'PostsController@store')-
>name('post.store');
Route::get('/post/delete/{id}', 'postsController@destroy')-
>name('post.delete');

    //route for Categorie
Route::get('/categories', 'CategoriesController@index')-
>name('categories');
Route::get('/category/edit/{id}', 'CategoriesController@edit')-
>name('category.edit');
Route::get('/category/delete/{id}', 'CategoriesController@destroy')-
>name('category.delete');
Route::get('/category/create', 'CategoriesController@create')-
>name('category.create');
Route::post('/category/store', 'CategoriesController@store')-
>name('category.store');
Route::post('/category/update/{id}', 'CategoriesController@update')-
>name('category.update');

    //route for Tag
        Route::get('/tags', 'TagController@index')->name('tags');
        Route::get('/tag/edit/{id}', 'TagController@edit')-
>name('tag.edit');
        Route::get('/tag/delete/{id}', 'TagController@destroy')-
>name('tag.delete');
        Route::get('/tag/create', 'TagController@create')-
>name('tag.create');
        Route::post('/tag/store', 'TagController@store')-
>name('tag.store');
        Route::post('/tag/update/{id}', 'TagController@update')-
>name('tag.update');

    //route for users
Route::get('/users', 'UsersController@index')->name('users');
Route::get('/users/admin/{id}', 'UsersController@admin')-
>name('users.admin'); //->middleware('admin');
Route::get('/users/notadmin/{id}', 'UsersController@notAdmin')-
>name('users.not.admin');
Route::get('/users/create', 'UsersController@create')-
>name('users.create');
Route::post('/users/store', 'UsersController@store')-
>name('users.store');

```

```

Route::get('/users/delete/{id}', 'UsersController@destroy')->name('users.delete');

//route for user profile
Route::get('/users/profile', 'ProfilesController@index')->name('users.profile');
Route::post('/users/profile/update', 'ProfilesController@update')->name('users.profile.update');
Route::get('/users/profile/create', 'ProfilesController@create')->name('users.profile.create');
//route for Settings
Route::get('/settings', 'SettingsController@index')->name('settings');
Route::post('/settings/update', 'SettingsController@update')->name('settings.update');

//route for User front end
Route::get('/', 'siteUIcontroller@index')->name('index');
Route::get('/category/{id}', 'siteUIcontroller@category')->name('category.show');
Route::get('/tag/{id}', 'siteUIcontroller@tag')->name('tag.show');

//route for admin dashboard
Route::get('/dashboard', 'HomeController@dashboard')->name('dashboard');

});

```

فيظهر لنا كما موضح بالصورة:

## Laravel-Header

لكي نقوم بعمل المشروع السابق وهو **HoursProject** نبدا أولاً بعمل **header.blade.php**  
فنقوم بعمل ملف **platformiq/resources/views/include/header.blade.php**  
ونعمل بداخله ملف **header.blade.php**  
ونكتب بداخله الكود التالي:

```
<html lang="en">
<head>
<meta charset="utf-8">
<meta http-equiv="X-UA-Compatible" content="IE=edge">
<meta name="viewport" content="width=device-width, initial-scale=1">
<title>Callie HTML Template</title>
<link href="https://fonts.googleapis.com/css?family=Montserrat:400,700%7CMu
li:400,700" rel="stylesheet">
<link type="text/css" rel="stylesheet"
href="{{asset('css/bootstrap.min.css')}}" />
<link rel="stylesheet" href="{{asset('css/font-awesome.min.css')}}"
}>
<link type="text/css" rel="stylesheet"
href="{{asset('css/style.css')}}" />
</head>
<body>
<header id="header">
<div id="nav">
<div id="nav-top">
<div class="container">
<ul class="nav-social">
<li><a href="/"><i ></i> <h4>{{$blog_name}}</h4> </a></li>
<li><a href="#"><i class="fa fa-facebook"></i></a></li>
<li><a href="#"><i class="fa fa-twitter"></i></a></li>
<li><a href="#"><i class="fa fa-google-plus"></i></a></li>
<li><a href="#"><i class="fa fa-instagram"></i></a></li>
</ul>
<div class="nav-btns">
<button class="aside-btn"><i class="fa fa-bars"></i></button>
<button class="search-btn"><i class="fa fa-search"></i></button>
<div id="nav-search">
<form method="GET" action="/results">
{{ csrf_field() }}
<input class="input" name="search" placeholder="Enter your
search..."/>
</form>
<button class="nav-close search-close">
<span></span>
</button>
</div>
</div>
</div>
<div id="nav-bottom">
<div class="container">
<ul class="nav-menu">
```

```

@foreach ($categories as $category)
<li><a href=""></a></li>
@endforeach
</ul>
</div>
</div>
<div id="nav-aside">
<ul class="nav-aside-menu">
<li><a href="{{ url('/') }}>Home</a></li>
<li class="has-dropdown"><a>Categories</a>
<ul class="dropdown">
@foreach ($categories as $category)
<li><a href="#">{{ $category->name }}</a></li>
@endforeach
</ul>
</li>
<li><a href="about.html">About Us</a></li>
<li><a href="contact.html">Contacts</a></li>
<li><a href="#">Advertise</a></li>
</ul>
<button class="nav-close nav-aside-close"><span></span></button>
</div>
</div>
</header>

```

ونكتب الامر التالي: `php artisan make:controller siteUIcontroller`

**سوف يقوم بعمل ملف `sitecontroller` في ملف `controolers`**

ونكتب فيه الكود التالي:

```

<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\Setting;
use App\category;
class siteUIcontroller extends Controller
{

    public function index()
    {
        return view('index')->with('blog_name' , Setting::first()->blog_name)
            ->with('categories' , Category::take(5)->get())
            ->with('tag' , $tag )      ;
    }

    ->with('first_post' , Post::orderBy('created_at','desc')->first())
}

}

```

فبعد الذهاب الى صفحة home ونضغط على اسم RahmaAltaee سوف تحولنا الى صفحة الموقع كما في الصورة:

او ندخل الى الموقع بطريقة اخر عن طريق نسخ هذا الرابط:  
ونسخة على google chrome [\[http://localhost:8000/\]](http://localhost:8000/)

فيظهر لنا الموقع والheader الذي قمنا بعمله كما في الصورة:

هذه الأسماء هي **tags** التي قمنا بدخالها في صفحة **createtags** وهذا قمنا باسترجاعها من قاعدة البيانات الى **header**

اما اسم المشروع **HoursProject** هو أيضا قمنا باسترجاعه من قاعدة البيانات من **settings** جدول

وأيضا قمنا بعمل قائمة منسلقة في **header** واسترجاع جميع **categories** التي قمنا بادخلها في صفحة **createcategories**

ف عند الضغط على هذه الايقونة

تظهر كما في الصورة:

# Laravel-Index

نقوم بعمل واجهة المشروع وعرضه للـ user فنعمل ملف `index.blade.php` في داخل ملف `platformiq/resources/views`

الكود التالي:

```
@include('include.header')
<div class="section">
<div class="container">
<div id="hot-post" class="row hot-post">
<div class="col-md-8 hot-post-left">
<div class="post post-thumb">
<a class="post-img" href="{{route('post.show', ['slug' => $first_post->slug])}}></a>
<div class="post-body">
<div class="post-category">
<a href="{{route('category.show', ['id' => $first_post->category->id])}}>{{$first_post->category->name}}</a>
</div>
<h3 class="post-title title-lg"><a href="#">{{$first_post->title}}</a></h3>

```

```

        </a>
    </div>
    <div class="aside-widget">
        <div class="section-title">
            <h2 class="title">Social Media</h2>
        </div>
        <div class="social-widget">
            <ul>
                <li>
                    <a href="#" class="social-facebook">
                        <i class="fa fa-facebook"></i>
                        <span>21.2K<br>Followers</span>
                    </a>
                </li>
                <li>
                    <a href="#" class="social-twitter">
                        <i class="fa fa-twitter"></i>
                        <span>10.2K<br>Followers</span>
                    </a>
                </li>
                <li>
                    <a href="#" class="social-google-plus">
                        <i class="fa fa-google-plus"></i>
                        <span>5K<br>Followers</span>
                    </a>
                </li>
            </ul>
        </div>
    </div>
    <div class="aside-widget">
        <div class="section-title">
            <h2 class="title">Categories</h2>
        </div>
        <div class="category-widget">
            <ul>
                @foreach ($categories as $category)
                <li><a href="#">{{ $category->name }} <span>451</span></a></li>
                @endforeach
            </ul>
        </div>
    </div>
    <div class="aside-widget">
        <div class="section-title">
            <h2 class="title">Newsletter</h2>
        </div>
        <div class="newsletter-widget">
            <form>
                <p>Nec feugiat nisl pretium fusce id velit ut tortor pretium.</p>
                <input class="input" name="newsletter" placeholder="Enter Your Email">
                <button class="primary-button">Subscribe</button>
            </form>
        </div>
    </div>
    <div class="aside-widget">
        <div class="section-title">
            <h2 class="title">Popular Posts</h2>
        </div>
    </div>

```

```

</div>
</div>
<div class="section-row loadmore text-center">
<a href="#" class="primary-button">Load More</a>
</div>
@include('include.footer')
<script src="js/jquery.min.js"></script>
<script src="js/bootstrap.min.js"></script>
<script src="js/jquery.stellar.min.js"></script>
<script src="js/main.js"></script>

</body>

</html>

```

ثم نذهب الى ملف **siteUlcontroller** ونكتب فيه الكود التالي:

```

<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\Setting;
use App\category;
use App\Tag;
use App\Post;
class siteUlcontroller extends Controller
{

public function index()
{
return view('index')->with('blog_name' , Setting::first()->blog_name)
->with('categories' , Category::take(5)->get() )
->with('tags' , Tag::take(5)->get() )
->with('first_post' , Post::orderBy('created_at','desc')->first())
->with('second_post' , Post::orderBy('created_at','desc')->skip(1)-
>take(1)->get()->first())
->with('third_post' , Post::orderBy('created_at','desc')->skip(2)-
>take(1)->get()->first())
->with('fourth_post' , Post::orderBy('created_at','desc')->skip(3)-
>take(1)->get()->first())
->with('Rolex' , Category::find(1) )
->with('settings' , Setting::first() )
->with('Omega' , Category::find(5) );
}

}

```

فيقوم باسترجاع البيانات من قاعدة البيانات إلى الصفحة الرئيسية كما في الصورة:

# Laravel-Footer

نقوم بعمل ملف include داخل ملف footer.blade.php  
ونكتب فيه الكود التالي:

```
<footer id="footer">
<div class="container">
<div class="row">
<div class="col-md-3">
<div class="footer-widget">

<p>{{ $settings->blog_name }} {{ $settings->phone_number }}</p>
{{ $settings->address }}</p>
<ul class="contact-social">
<li><a href="#" class="social-facebook"><i class="fa fa-facebook"></i></a></li>
<li><a href="#" class="social-twitter"><i class="fa fa-twitter"></i></a></li>
<li><a href="#" class="social-google-plus"><i class="fa fa-google-plus"></i></a></li>
<li><a href="#" class="social-instagram"><i class="fa fa-instagram"></i></a></li>
</ul>
</div>
</div>
<div class="col-md-3">
<div class="footer-widget">
<h3 class="footer-title">Categories</h3>
<div class="category-widget">
<ul>
@foreach ($categories as $category)
<li><a href="#">{{ $category->name }} <span>451</span></a></li>
@endforeach
</ul>
</div>
</div>
</div>
<div class="col-md-3">
<div class="footer-widget">
<h3 class="footer-title">Tags</h3>
<div class="tags-widget">
<ul>
@foreach ($tags as $tag)
<li><a href="#">{{ $tag->tag }} </a></li>
@endforeach
</ul></div>
</div>
<div class="col-md-3">
<div class="footer-widget">
<h3 class="footer-title">Newsletter</h3>
<div class="newsletter-widget">
```

```
<form>
<p>Nec feugiat nisl pretium fusce id velit ut tortor pretium.</p>
<input class="input" name="newsletter" placeholder="Enter Your Email">
<button class="primary-button">Subscribe</button>
</form>
</div>
</div>
</div>
<div class="footer-bottom row">
<div class="col-md-6 col-md-push-6">
<ul class="footer-nav">
<li><a href="index.html">Home</a></li>
<li><a href="about.html">About Us</a></li>
<li><a href="contact.html">Contacts</a></li>
<li><a href="#">Advertise</a></li>
<li><a href="#">Privacy</a></li>
</ul>
</div>
<div class="col-md-6 col-md-pull-6">

# Laravel-Category

الآن عند الضغط على الصورة في `index` فسوف تحولنا الى صفحة `category` وتعطينا تفاصيل الصورة :  
فنكتب الكود التالي داخل ملف `siteUIcontroller.php`

```
<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\Setting;
use App\category;
use App\Tag;
use App\Post;
class siteUIcontroller extends Controller
{

public function index()
{
    return view('index')->with('blog_name' , Setting::first()->blog_name)
->with('categories' , Category::take(5)->get() )
->with('tags' , Tag::take(5)->get() )
->with('first_post' , Post::orderBy('created_at','desc')->first())
->with('second_post' , Post::orderBy('created_at','desc')->skip(1)-
>take(1)->get()->first())
->with('third_post' , Post::orderBy('created_at','desc')->skip(2)-
>take(1)->get()->first())
->with('fourth_post' , Post::orderBy('created_at','desc')->skip(3)-
>take(1)->get()->first())
->with('Rolex' , Category::find(1) )
->with('settings' , Setting::first() )
->with('Omega' , Category::find(5) )
;
}

public function showPost($slug)
{

$post      = Post::where('slug' , $slug)->first();
$next_page = Post::where('id' , '>' , $post->id)->min('id');
$prev_page = Post::where('id' , '<' , $post->id)->max('id');

return view('posts.show')

->with('tags' , Tag::all() )
->with('post' , $post)
->with('next' , Post::find($next_page))
->with('prev' , Post::find($prev_page))
->with('title' , $post->title)
->with('blog_name' , Setting::first()->blog_name)
->with('settings' , Setting::first() )
->with('categories' , Category::take(5)->get() );
}
```

```

    }

public function category($id)
{
    $category      = Category::find($id) ;

    return view('categories.category')
->with('tags' , Tag::all() )
->with('title' , $category->name)
->with('categories' , Category::take(5)->get() )
->with('blog_name' , Setting::first()->blog_name)
->with('settings' , Setting::first() )
->with('name' , $category->name )
->with('category' , $category ) ;
}

}

```

ثم نعمل صفحة داخل ملف front.blade.php ونكتب فيه الكود التالي:

```

@include('include.header')

{{ $title }}</h1>
<p class="lead">{{ $post->category->name }}</p>
</div>
</div>
</div>
</div>
</header>
<div class="section">
<div class="container">
<div class="row">
<div class="col-md-8">
<div class="section-row">
<div class="section-title">
<h3 class="title">{{ $title }}</h3>
</div>

<h1>{{ $post->created_at->toFormattedDateString() }}</h1>
<p>{!! $post->content !!}
@foreach ($post->tags as $tag)
<a href="#" class="badge badge-pill badge-danger" style="background-color:#ff0a0a">{{ $tag->tag }}</a>
@endforeach
</div>

<div class="section-row">
<div class="section-title">
</div>
<br>
@if($prev)

```

```

<a href="{{route('post.show', ['slug' => $prev->slug])}}"
class="badge badge-dange"> next=>{$prev->title}</a>
@endif()
@if ($next)
<a href="{{route('post.show', ['slug' => $next->slug])}}"
class="badge badge-"> prev=>{$next->title}</a>
@endif

</div>

<div class="section-row">
<div class="section-title">

<h3 class="title">AllTags</h3>
</div>
<br>
@foreach($tags as $tag)
<a href="{{route('tag.show', ['id' => $tag->id])}}" class="badge
badge-pill badge-danger"
style="background-color: #ee4266;">{{ $tag->tag }}</a>
@endforeach
</div>
@include('include.disqus')
</div>
<div class="col-md-4">
<div class="aside-widget">
<div class="section-title">
<h2 class="title">Social Media</h2>
</div>
<div class="social-widget">
<ul>
<li>
<a href="#" class="social-facebook">
<i class="fa fa-facebook"></i>
<span>21.2K<br>Followers</span>
</a>
</li>
<li>
<a href="#" class="social-twitter">
<i class="fa fa-twitter"></i>
<span>10.2K<br>Followers</span>
</a>
</li>
<li>
<a href="#" class="social-google-plus">
<i class="fa fa-google-plus"></i>
<span>5K<br>Followers</span>
</a>
</li>
</ul>
</div>
</div>
<div class="aside-widget">
<div class="section-title">
<h2 class="title">Newsletter</h2>
</div>
<div class="newsletter-widget">
<form>
<p>Nec feugiat nisl pretium fusce id velit ut tortor pretium.</p>
<input class="input" name="newsletter" placeholder="Enter Your
Email">

```

```

<button class="primary-button">Subscribe</button>
</form>
</div>
</div>
</div>
</div>
</div>
</div>
@include('include.footer')
<script src="js/jquery.min.js"></script>
<script src="js/bootstrap.min.js"></script>
<script src="js/jquery.stellar.min.js"></script>
<script src="js/main.js"></script>

</body>
</html>

```

وملف `disqus.blade.php` ونكتب فيه الكود التالي:

```

<div id="disqus_thread"></div>
<script>
https://disqus.com/admin/universalcode/#configuration-variables*
(function() { // DON'T EDIT BELOW THIS LINE
var d = document, s = d.createElement('script');
s.src = 'https://fedora-linux-blog.disqus.com/embed.js';
s.setAttribute('data-timestamp', +new Date());
(d.head || d.body).appendChild(s);
})();
</script>
<noscript>Please enable JavaScript to view the <a href="https://disqus.com/?ref_noscript">comments powered by Disqus.</a></noscript>

```

وملف `web.php` ونكتب فيه الكود التالي:

```

<?php

Auth::routes();

Auth::routes(['verify' => true]);
Route::get('/home', 'HomeController@index')->name('home');

//Route::group(['prefix' => 'user', 'middleware'=>'auth'], function()
// {
Route::group(['middleware'=>'auth'], function () {

    //route for posts
Route::get('/posts', 'PostsController@index')->name('posts');
Route::get('/post/trashed', 'PostsController@trashed')-

Route::get('/dashboard', 'HomeController@dashboard')->name('dashboard');
Route::get('/{slug}', 'siteUIcontroller@showPost')->name('post.show');
});

```

فبعد الضغط على هذه الصورة تذهب الى **category** لصورة نفسها

والصورة الثانية أيضا عند الضغط عليها يظهر category كما في الصورة:

The screenshot shows a website header with navigation links for ROLEX, OMEGA, RADO, TAG HEUER, and BREITLING. Below the header is a large image of a luxury watch with 'TURKEY' and 'Omega' printed on its dial. To the left of the image, the word 'TURKEY' is written in bold capital letters. To the right, there's a section titled 'SOCIAL MEDIA' with three colored boxes: blue for Facebook (21.2K Followers), cyan for Twitter (10.2K Followers), and orange for Google+ (5K Followers). Below this is a 'NEWSLETTER' section with a placeholder for an email address and a 'SUBSCRIBE' button. At the bottom, there's a Disqus comment section with a placeholder 'Start the discussion...', social sharing icons for LinkedIn, Facebook, Twitter, and Google+, and a 'LOG IN WITH' section featuring icons for LinkedIn, Facebook, Twitter, and Google.

## Laravel-Tag

الآن عند الضغط على اسم الصورة في index فسوف تحولنا الى صفحة Tag وتعطينا

تفاصيل ال :tag

فنكتب الكود التالي داخل ملف siteUIcontroller.php

```
<?php

namespace App\Http\Controllers;

use Illuminate\Http\Request;
use App\Setting;
use App\category;
use App\Tag;
use App\Post;
class siteUIcontroller extends Controller
{

    public function index()
    {
        return view('index')->with('blog_name' , Setting::first()->blog_name)
        ->with('categories' , Category::take(5)->get() )
        ->with('tags' , Tag::take(5)->get() )
        ->with('first_post' , Post::orderBy('created_at','desc')->first())
        ->with('second_post' , Post::orderBy('created_at','desc')->skip(1)-
        >take(1)->get()->first())
        ->with('third_post' , Post::orderBy('created_at','desc')->skip(2)-
        >take(1)->get()->first())
        ->with('fourth_post' , Post::orderBy('created_at','desc')->skip(3)-
        >take(1)->get()->first())
        ->with('Rolex' , Category::find(1) )
        ->with('settings' , Setting::first() )
        ->with('Omega' , Category::find(5) )
    }

    public function showPost($slug)
    {

        $post      = Post::where('slug' , $slug)->first();
        $next_page = Post::where('id' , '>' , $post->id)->min('id');
        $prev_page = Post::where('id' , '<' , $post->id)->max('id');

        return view('posts.show')

        ->with('tags' , Tag::all() )
        ->with('post' , $post)
        ->with('next' , Post::find($next_page))
        ->with('prev' , Post::find($prev_page))
        ->with('title' , $post->title)
        ->with('blog_name' , Setting::first()->blog_name)
        ->with('settings' , Setting::first() )
    }
}
```

```

->with('categories' , Category::take(5)->get() )    ;
}

public function category($id)
{
    $category      = Category::find($id) ;

    return view('categories.category')
->with('tags' , Tag::all() )
->with('title' , $category->name)
->with('categories' , Category::take(5)->get() )
->with('blog_name' , Setting::first()->blog_name)
->with('settings' , Setting::first() )
->with('name' , $category->name )
->with('category' , $category )    ;
}

public function tag($id)
{
    $tag      = Tag::find($id) ;

    return view('tags.tags')

->with('title' , $tag->tag)
->with('categories' , Category::take(5)->get() )
->with('blog_name' , Setting::first()->blog_name)
->with('settings' , Setting::first() )
->with('name' , $tag->name )

->with('tag' , $tag )    ;
}
}
}

```

ملف index.blade.php ونضيف فيه الكود التالي:

```

@include('include.header')
<div class="section">
<div class="container">
<div id="hot-post" class="row hot-post">
<div class="col-md-8 hot-post-left">
<div class="post post-thumb">
<a class="post-img" href="{{route('post.show', ['slug' =>
$first_post->slug])}}></a>
<div class="post-body">
<div class="post-category">
<a href="{{route('category.show', ['id' => $first_post->category-
>id])}}>{{$first_post->category->name}}</a>
</div>
<h3 class="post-title title-lg"><a href="#">{{$first_post-
>title}}</a></h3>
<ul class="post-meta">
<li><a href="#">John Doe</a></li>
    <li>{{$first_post->created_at->diffForHumans() }}</li>

```

```
</ul>
</div>
</div>
</div>
<div class="col-md-4 hot-post-right">
<div class="post post-thumb">
<a class="post-img" href="{{route('post.show', ['slug' => $second_post->slug])}}></a>
<div class="post-body">
<div class="post-category">
<a href="{{route('category.show', ['id' => $second_post->category->id])}}>{{$second_post->category->name}}</a>
</div>
<h3 class="post-title"><a href="#">{{$second_post->title}}</a></h3>
<ul class="post-meta">
<li><a href="author.html">John Doe</a></li>
<li>{{$second_post->created_at->diffForHumans()}}</li>
</ul>
</div>
</div>
<div class="post post-thumb">
<a class="post-img" href="{{route('post.show', ['slug' => $third_post->slug])}}></a>
<div class="post-body">

Lorem Ipsum is simply dummy text of the printing and typesetting industry. Lorem Ipsum has been the industry's standard dummy text ever since the 1500s, when an unknown printer took a galley of type and scrambled it to make a type specimen book. It has survived not only five centuries, but also the leap into electronic typesetting, remaining essentially unchanged. It was popularised in the 1960s with the release of Letraset sheets containing Lorem Ipsum passages, and more recently with desktop publishing software like Aldus PageMaker including versions of Lorem Ipsum

# Laravel-Search

نعمل `search` فدخل الى ملف `web.php` ونكتب فيه الكود التالي:

```
<?php

Auth::routes();

Auth::routes(['verify' => true]);
Route::get('/home', 'HomeController@index')->name('home');

//Route::group(['prefix' => 'user', 'middleware'=>'auth'], function()
() {
Route::group(['middleware'=>'auth'], function () {

    //route for posts
Route::get('/posts', 'PostsController@index')->name('posts');
Route::get('/post/trashed', 'PostsController@trashed')-
>name('post.trashed');
Route::get('/post/hdelete/{id}', 'PostsController@hdelete')-
>name('post.hdelete');
Route::get('/post/restore/{id}', 'PostsController@restore')-
>name('post.restore');
Route::get('/post/edit/{id}', 'PostsController@edit')-
>name('post.edit');
Route::post('/post/update/{id}', 'PostsController@update')-
>name('post.update');
Route::get('/post/create', 'PostsController@create')-
>name('post.create');
Route::post('/post/store', 'PostsController@store')-
>name('post.store');
Route::get('/post/delete/{id}', 'postsController@destroy')-
>name('post.delete');

    //route for Categorie
Route::get('/categories', 'CategoriesController@index')-
>name('categories');
Route::get('/category/edit/{id}', 'CategoriesController@edit')-
>name('category.edit');
Route::get('/category/delete/{id}', 'CategoriesController@destroy')-
>name('category.delete');
Route::get('/category/create', 'CategoriesController@create')-
>name('category.create');
Route::post('/category/store', 'CategoriesController@store')-
>name('category.store');
Route::post('/category/update/{id}', 'CategoriesController@update')-
>name('category.update');

    //route for Tag
        Route::get('/tags', 'TagController@index')->name('tags');
        Route::get('/tag/edit/{id}', 'TagController@edit')-
>name('tag.edit');
        Route::get('/tag/delete/{id}', 'TagController@destroy')-
>name('tag.delete');
    }
```

```

        Route::get('/tag/create', 'TagController@create')-
>name('tag.create');
        Route::post('/tag/store', 'TagController@store')-
>name('tag.store');
        Route::post('/tag/update/{id}', 'TagController@update')-

## الآن في النهاية نقوم بتنزيل Laratrust

نكتب الامر أولاً: `composer require santigarcor/laratrust`

ثانياً: `php artisan vendor:publish --tag="laratrust"`

ثالثاً: في حالة الخطأ نستخدم هذا الامر `php artisan config:clear`

رابعاً: `php artisan laratrust:setup`

خامساً: `composer dump-autoload`

سادساً: `php artisan migrate`

نقوم بتنزيل Send grid send email

وداخل ملف config/mail.php ونكتب فيه الكود الآتي:

```
<?php

return [
    'driver' => env('MAIL_DRIVER', 'smtp'),
    'host' => env('MAIL_HOST', 'smtp.mailgun.org'),
    'port' => env('MAIL_PORT', 587),
    'from' => [
        'address' => env('MAIL_FROM_ADDRESS', 'hello@example.com'),
        'name' => env('MAIL_FROM_NAME', 'Example'),
    ],
    'encryption' => env('MAIL_ENCRYPTION', 'tls'),
    'username' => env('MAIL_USERNAME'),
    'password' => env('MAIL_PASSWORD'),
    'sendmail' => '/usr/sbin/sendmail -bs',
    'markdown' => [
        'theme' => 'default',
        'paths' => [
            resource_path('views/vendor/mail'),
        ],
    ],
    'hannel' => env('MAIL_LOG_CHANNEL'),
];

```

وملف resources/views/emails/test.blade.php

ونكتب فيه الكود الآتي:

```
<html lang="en-US">
<head>
<meta charset="utf-8">
</head>
<body>
```

```
<h2>Test Email</h2>
<p> </p>
</body>
</html>
```

ولكن نعمل بالبداية تسجيل دخول الى send grid email وعند ارسال أي تعليق من صفحة category عبر ايميل سوف يرسل الى send grid وتنتم العملية بنجاح
